PART 1

Getting Started

What Odo is, how to get around, and what your role can open.

Welcome to Odo

- CHANNELS
- SALES OPS
- ADMIN
- SUPER ADMIN

Odo is the one place where every LOT sale is counted, whatever channel it came from. It pulls Website, Amazon, Flipkart, quick-commerce, General and Modern Trade and the long-tail channels into a single set of numbers, so a question like "what did we sell last month?" has one answer instead of nine.

WHAT IT'S FOR	READ OR ACT?	WHO	UPDATES
Consolidated sales across every channel.	Mostly read. A few screens keep the feeds healthy.	CHANNELS SALES OPS SUPER ADMIN	Hourly, with Website every 5 minutes.

Why this manual leads with definitions

Most disagreements about an Odo number are not errors. They are two people using the same word to mean different things.

The clearest example, and the reason this manual exists: when the Channels team says **gross**, they usually mean revenue with returns, refunds and taxes already taken out. When Odo says **gross**, it means the opposite end of the ladder: the full order value before discounts, with tax still inside it. Both are reasonable. Neither is wrong. But if one person quotes Odo's gross into a conversation built on the other definition, the two figures will differ by a wide margin and everybody will start hunting for a bug that is not there.

So the second part of this manual, *The Definitions*, is the part to read first. Every other chapter assumes you have.

✓ TIP

If a number in Odo disagrees with a number in a channel's own portal, check the definition before checking the feed. In practice that is where the difference usually lives.

What Odo is not

Not an order manager	You cannot pick, pack, cancel or refund anything here. Odo reads what other systems did. Dispatch happens in Depot, procurement in Snorkel, customer conversations in Pitstop.

Not the invoice	Odo is a management view. The GST invoice and the filed return are produced elsewhere and are the authority for tax.
Not real time, except where it says so	Almost everything refreshes hourly. Only the Live screen and Website stock are faster. A figure for the last hour is normal to see move.

Where the numbers come from

Each channel has a **connector** that fetches its sales on a schedule and stages them. A shared calculation then turns those staged rows into the facts every screen reads. Two things follow from that design and are worth knowing early:

- **Re-pulling the same period is safe.** The calculation replaces a day rather than adding to it, so a feed that runs twice does not double a number.
- **A correction lands on the original date.** If an order placed on the 3rd is cancelled on the 9th, the 3rd changes. Yesterday's report can legitimately look different today.

⚠ WATCH OUT

Because corrections back-date, a figure you screenshoted last week may not match the same figure today, and both can be correct. When you publish a number, publish the date you pulled it.

Signing In & Getting Around

- CHANNELS
- SALES OPS
- ADMIN
- SUPER ADMIN

Odo signs in with your Legend of Toys Google account. What you see in the left rail depends on your role, so two people can open the same link and get different screens.

SIGN IN Google, legendoftoys.com only.	ADDRESS odo.legendoftoys.com	SEARCH 🔍 K	ON A PHONE Same screens, five tabs along the bottom.
--	--	---	--

Getting around

The left rail groups every screen under five headings, and they follow the shape of the data rather than the shape of the org:

GROUP	WHAT LIVES THERE
Overview	Dashboard and Live. Where you land, and what is happening right now.
Sales	Performance, Channels, Marketing, Funnel. Revenue over time and where it came from.
Catalog	Products, P&L, Inventory. The same money cut by product instead of by channel.
Pipeline	Dyno, Mapping, Connectors, Uploads. The plumbing behind every other screen.
Admin	Access and channel configuration.

The date range applies to the screen you are on

Most screens carry a range picker with Today , 7D , 30D , 90D , MTD , Last mo and FY shortcuts. The range does not follow you between screens, so if two screens disagree, check that both are set to the same period before assuming anything is broken.

The freshness stamp, and how to read it honestly

The header carries a "Data as of" chip. It shows the **oldest** feed among those the current screen actually reads, not the newest, and that is deliberate: a stale channel can never hide behind a fresh one sitting next to it.

Green	Everything this screen reads was refreshed within about three hours.
Amber	Something is up to a day behind. Usable, but say so if you are quoting it.
Red	More than a day behind, or a feed reported an error. Check Connectors before using the number.

① **NOTE**

A healthy feed that simply had no sales still counts as fresh. "We checked and there was nothing" is a success, not a failure, so a quiet channel does not turn the chip red.

Roles & What You Can See

- CHANNELS
- SALES OPS
- ADMIN
- SUPER ADMIN

Odo has its own access list, separate from every other LOT app. Being an admin in Garage or Redline gives you nothing here.

ACCESS MODEL	DEFAULT	MOST RESTRICTED	KILL SWITCH
Per-system, managed on Admin.	No role means no access at all.	P&L: Super Admin only.	A role can be switched off without deleting it.

The roles

ROLE	CAN OPEN
CHANNELS	Every reporting screen: Dashboard, Live, Performance, Channels, Marketing, Funnel, Products, Inventory, Dyno. Not P&L.
SALES OPS	The above, plus the Pipeline screens that keep data flowing: Mapping, Uploads, Connectors.
ADMIN	The above, plus Admin: who has access, and channel configuration.
SUPER ADMIN	Everything, and the only role that can open P&L.

Why P&L is walled off

P&L carries product cost, margin, marketing spend and staff cost. That is the most commercially sensitive data in Odo, so it sits behind the single narrowest gate in the app rather than behind an ordinary permission. If you can see revenue but not margin, that is the design working, not a misconfiguration.

⚠ WATCH OUT

Screenshots leak permissions. A P&L figure pasted into a channel thread is visible to everyone in it, whatever their Odo role. Quote revenue freely; treat cost and margin as need-to-know.

PART 2

The Definitions

Read this part before quoting any Odo number. Most disagreements between Odo and a channel report are definition differences, not errors.

Gross, Net and the Revenue Ladder

CHANNELS

SALES OPS

ADMIN

SUPER ADMIN

This is the chapter that settles most arguments. Odo and the Channels team both say "gross" and mean opposite ends of the same ladder. Neither is wrong; they are different rungs.

ODO'S HEADLINE	ODO'S GROSS	CHANNELS' GROSS	RULE
Net revenue, ex-GST.	Before discounts, tax still inside.	Usually after returns and tax.	Name the rung, not just the word.

The ladder, top to bottom

Every revenue figure in Odo is one of these rungs. Read down the list and stop where your question is:

RUNG	WHAT IT IS
Gross	The full order value before discounts , with GST still inside it . This is the widest number Odo holds.
– Discounts	Coupon codes, promotions and order-level discounts.
– Cancellations	The whole order removed, dated to when it was placed.
– Returns	Refunds and RTOs, dated to when they came back.
– GST	Tax stripped out, so what is left is the taxable base.
= Net revenue	The headline. What LOT actually earned, excluding tax.

 **IMPORTANT**

Net is the metric. Gross exists so channels can be compared on the same basis and so the ladder has a starting point. The business does not work off gross, and a gross figure quoted as "revenue" will overstate what was earned.

Why Odo's gross includes tax

Channels report differently: some quote prices with tax inside, some without. If Odo copied each channel's own convention, the channels could not be added together or compared. So every channel is normalised to the same tax-inclusive basis on the way in, the real tax is captured separately, and tax is

stripped once at the end. That is why the top of the ladder looks larger than you might expect, and why the bottom is trustworthy.

Translating between Odo and a channel report

When someone hands you a figure, ask which of these it is before comparing:

"Gross" from a channel	Usually already net of returns and tax. That is close to Odo's net , not Odo's gross. Compare it to net.
"Total sales" from a portal	Almost always tax-inclusive and before returns. Closest to Odo's gross , though timing will still differ.
"Settlement" or "payout"	Neither rung. That is money received after the platform took its fees, and Odo does not treat it as revenue.

✓ TIP

A reconciliation that is out by roughly the tax rate is a definition mismatch, not a data problem. A reconciliation out by a few percent is usually timing. A reconciliation out by a lot is worth reporting.

How the GST rung actually works

The – GST rung is not one flat rate everywhere; it uses the best tax figure each channel can honestly supply. Website (Shopify), GT, MT, Peeko and Flipkart Managed strip the exact GST invoiced on each order, so a 5% line like L.O.T Build nets correctly (shipped 2026-09-07). Quick-commerce (Blinkit, Zepto, Instamart) strips GST per SKU from its HSN rate (shipped 2026-09-01). Amazon still strips a flat 18%, deliberately: Amazon's exact GST only arrives through settlement weeks later, with roughly a quarter of it confirmed within 14 days, so using it live would overstate net on recent days; a "settled %" badge shows how much of the period's GST is confirmed. Cred, Firstcry and Flipkart Managed now strip the exact GST too (shipped 2026-09-09). Those three come through Uniware, which supplies the real tax on every line; Odo had been ignoring it and stripping a flat 18% instead. The same fix corrected a larger error underneath it: Uniware's *discount* field records an amount it has **already** taken off the selling price, and Odo was subtracting it a second time. Firstcry's net revenue was understated by roughly its whole discount — enough to read as a negative figure — and is now correct.

A per-order or per-SKU tax figure is only trusted when it is a plausible share of the order value, between 3% and 20%. Outside that range the flat strip is used instead, and it is never zero: a missing or implausible tax figure would otherwise overstate net.

Orders, Units and AOV

CHANNELS

SALES OPS

ADMIN

SUPER ADMIN

Orders and units are not interchangeable, and the difference has caused a real reconciliation dispute. This chapter says exactly which one each Odo figure is.

ORDER One customer purchase, any number of items.	UNIT One physical item sold.	AOV Gross ÷ orders.	CANCELLED Orders , never units.
--	---------------------------------	------------------------	---

Which figures are orders, and which are units

FIGURE	COUNTS
Total Orders	Orders . Non-cancelled, with free replacements removed.
Units	Units . The quantity across the lines on those orders.
AOV	Gross ÷ orders . Not net, and not per unit. Shown including GST, with the ex-GST figure on the line beneath.
Cancelled	Orders . See the warning below.
Returns	Return events, with their own value.

⚠ IMPORTANT

Odo's cancellation figure is **ORDERS**, and it cannot be converted to units. Amazon writes the quantity down to zero on a cancelled line in the report we receive, so the units are simply not in the data. If a channel report gives cancelled *units* and Odo gives cancelled *orders*, the two will not agree and no amount of arithmetic on our side will make them. This is a known limit, not a bug, and the figures should never be presented as if they measure the same thing.

Free replacements are excluded from orders and AOV

When a customer receives a faulty item and we ship another, that replacement arrives in the feed as an order worth zero. Counting it as an order would quietly drag AOV down every month for something that is a fulfilment event rather than a sale.

So replacements are **removed** from Total Orders and from AOV, and shown on their own tile instead. Nothing is hidden: the count is visible, it is just not mixed into the sales figures.

⚠ WATCH OUT

This changed part-way through the year. An AOV you reconciled against before the change will be lower than today's figure for the same month, and today's is the intended one. If you keep a historical comparison, re-baseline it once rather than treating the gap as an error.

Why AOV uses gross rather than net

AOV is a basket-size measure: it answers "how much does a typical customer put in the cart?". That question is about the order as placed, before we net off returns that happen weeks later and before tax is stripped. Using net would mix a basket question with a settlement question and make the trend hard to read.

AOV with and without GST

The big number on the AOV tile **includes GST**, because that is what the customer paid and what the e-commerce team reconciles against. The line underneath gives the **same basket without GST**: the same orders and the same value, with only the tax taken out. It is the same pattern as the Total Sales tile on the Amazon page.

The tax is taken out at each product's real rate where the channel tells us the tax on each order, so a 5% L.O.T Build basket is not stripped as if it were 18%. On Amazon, where the exact tax arrives weeks late, it is a flat 18%.

Cancellations, Returns and RTO

CHANNELS

SALES OPS

ADMIN

SUPER ADMIN

Three different things reduce revenue and they are counted separately, on different dates. Mixing them up double-counts.

CANCELLATION	RETURN	RTO	RULE
Never shipped. Dated to the order.	Shipped, came back. Dated to the refund.	Never accepted. Counted as a return.	An order is only ever one of these.

The three, precisely

Cancellation	The order was stopped before it went anywhere. The whole order is excluded, and the exclusion lands on the date the order was placed . So a cancellation today changes a past day's figure.
Return	The customer received the goods and sent them back, and a refund was issued. Counted on the date of the refund , not the sale, because that is when the money went out.
RTO	Return to origin: the parcel went out but the customer never took delivery. An RTO is a return . It is netted off on the date the parcel came back.

🚫 IMPORTANT

An RTO on a cash-on-delivery order has no refund, because no money was ever collected.

That is exactly why it used to fall through the ladder: it was not cancelled, so it was not excluded, and there was no refund to net off. Goods that came back were being counted as revenue. RTOs are now netted properly. If you have historical figures from before that fix, they overstate revenue on COD-heavy channels.

Why a cancelled order is not also a return

A cancelled order sometimes carries a refund record too. Counting both would remove the same money twice, so Odo takes the cancellation and ignores the refund on that order. Similarly, when an RTO also has a genuine refund, the refund wins, because it carries the real date and the real amount.

① **NOTE**

Because returns land on the refund date and cancellations land on the order date, a month's revenue keeps moving for a while after the month ends. That settling is normal. It is also why the most recent two weeks should be treated as provisional in any trend you publish.

What Counts as a Sale on Each Channel

- CHANNELS
- SALES OPS
- ADMIN
- SUPER ADMIN

"A sale" does not mean the same event on every channel, because LOT does not have the same commercial relationship with every channel. This chapter says what Odo counts, channel by channel.

DEFAULT	EXCEPTION	GRAIN	DAY
The consumer's purchase.	Outright buyers: our sale to them.	Date x channel x product.	IST, not UTC.

Two kinds of channel

Everything turns on who owns the stock when the consumer buys it.

We sell to the consumer	Website, Amazon, and the quick-commerce platforms. The stock is ours until a shopper buys it, so the consumer purchase is the sale and that is what Odo counts.
They buy from us outright	Flipkart Managed, General Trade, Modern Trade, Peeko. They purchase stock on a PO and then sell it on their own account. Our sale to them is the sale , and Odo counts the confirmed sales order.

⚠ WATCH OUT

For an outright buyer, Odo shows **nothing** about what they subsequently sold to shoppers. That is not a gap in the data; we genuinely do not receive it and it is not ours to count. If someone asks "how is Flipkart selling through?", Odo cannot answer that question, and no screen in it should be read as if it can.

Channel by channel

CHANNEL	WHAT ODO COUNTS AS THE SALE
Website	The Shopify order.
Amazon	The marketplace order.

CHANNEL	WHAT ODO COUNTS AS THE SALE
Quick-commerce (Blinkit, Zepto, Instamart)	Units sold as reported by the platform, uploaded from their seller portal.
Flipkart Managed	The purchase order. Flipkart buys outright.
General Trade / Modern Trade	The confirmed sales order.
Peeko	The confirmed sales order. Outright purchase, same as the above.
Cred, Firstcry	The consumer order, via our fulfilment system.
Ozi	Not in Odo. Self-reported monthly at MIS time, so there is no feed to read.

Flipkart changed, and it was not a broken feed

Flipkart used to be a marketplace where LOT was the seller, so consumer orders flowed to us. They now buy outright. Consumer sales therefore stopped reaching our systems in June by design, and Odo's Flipkart number switched to the purchase order. Anyone looking at a long Flipkart trend will see the basis change mid-year. It is a commercial change, not a data one.

① NOTE

The day boundary is **IST**. A sale placed at 11pm on the 3rd belongs to the 3rd, not the 4th. Channel portals often report in their own timezone, which is a common source of small day-level differences at month ends.

What Is Deliberately Left Out

- CHANNELS
- SALES OPS
- ADMIN
- SUPER ADMIN

Some real money is deliberately kept out of Odo's totals. Each exclusion is a decision, not an oversight, and knowing them prevents a fruitless hunt for a missing number.

ACCESSORIES	REPLACEMENTS	UNMAPPED SKUS	OZI
Shown, but outside every total.	Out of orders and AOV.	Held back until identified.	Not fed in at all.

Accessories and others

Gift wrapping, spare parts and paid repairs are bundled onto a single line on the Dashboard and are **deliberately not counted** in Website revenue or units. They are real money, but they are not product sales, and folding them in would inflate per-variant figures and restate months of already-published numbers.

So a figure appearing on that line and not in the totals is correct behaviour. It is a memo, shown so nothing is hidden.

Unmapped SKUs

When a channel sends a product code Odo does not recognise, the sale is held in a queue rather than guessed at. It is excluded from the totals until a human says which product it is, and the moment they do, the history backfills automatically.

This is why a channel figure can rise retrospectively: somebody resolved a mapping, and revenue that was always real became attributable. Most of the queue is zero-value replacement and spare-part codes that will never be mapped; only a minority carries value.

✓ TIP

A product name that Odo does not recognise is not always an unregistered product. LOT has sometimes sold the **same** item under a different name on a different channel, because margins differed by channel. Before concluding a SKU was never set up, ask whether it is an old alias.

Multi-channel fulfilment

A number of Amazon rows are orders Amazon fulfilled on our behalf that were placed somewhere else, and they arrive valued at zero. Revenue is unaffected, because zero is correct, but they

do lift Amazon's **unit** count slightly and drag its average selling price down. This is known and currently accepted.

Settlement, fees and payouts

What a platform actually pays us is not revenue. Fees and settlements appear in P&L as costs, not as a reduction of the top line. If you are reconciling a bank credit to Odo, expect a gap the size of the platform's commission, and expect it to be legitimate.

IMPORTANT

Every exclusion here is a recorded decision. If one of them looks like a bug and you are tempted to "fix" it, raise it first. Several have been re-argued and re-confirmed more than once, and reversing one silently would move numbers the business has already published.

PART 3

Overview

The screens you open first.

Dashboard

/

CHANNELS

SALES OPS

ADMIN

SUPER ADMIN

The landing screen: how the business is trading right now, across every channel at once, with the biggest movers called out.

WHAT IT'S FOR One view of all channels.	READ OR ACT? Read-only.	WHO CHANNELS SALES OPS	UPDATES Hourly.
---	---	---	---------------------------------------

Reading the tiles

The headline figures follow the ladder in *Gross, Net and the Revenue Ladder*. Net is the one to quote. Comparisons are against the equivalent previous period, so a 30-day view compares to the 30 days before it, not to last calendar month.

⚠ WATCH OUT

The **Accessories and others** line is a memo and sits outside every total on this screen. Adding it to the revenue tile will not reconcile with anything.

Product search

The product table can be searched directly, which is usually faster than going to Products when you have a specific SKU in mind.

✓ TIP

If a channel looks unexpectedly flat, check its trailing baseline before raising it. A drop from an unusually high week is a return to normal, not a collapse. This has been mistaken for a broken feed more than once.

Live

/live

CHANNELS

SALES OPS

ADMIN

SUPER ADMIN

Near-real-time Website orders. An order placed on the site appears here within seconds, which makes this the screen to watch during a launch, a campaign or a suspected outage.

WHAT IT'S FOR Website trading, right now.	READ OR ACT? Read-only.	WHO CHANNELS SALES OPS	UPDATES Seconds, via webhook.
--	----------------------------	------------------------------	----------------------------------

Website only

Live covers the Website and nothing else. Marketplaces do not push orders to us as they happen, so a quiet Live screen says nothing at all about Amazon or quick-commerce.

NOTE

Live is fed by a different mechanism from the hourly figures, so Live and the Dashboard can differ for a short while. Live is ahead, not more correct: the hourly calculation is what settles cancellations and returns.

Today window and the product table

The Today window shows the day so far in IST, and the searchable product table shows what is actually moving. During a launch this is the fastest way to see whether the thing you launched is the thing selling.

PART 4

Sales

Performance over time, channel by channel, plus marketing and the funnel.

Performance

/performance

CHANNELS

SALES OPS

ADMIN

SUPER ADMIN

Revenue over time with the full net ladder laid out, so you can see exactly where gross became net.

WHAT IT'S FOR The trend, and the ladder behind it.	READ OR ACT? Read-only.	WHO CHANNELS	UPDATES Hourly.
---	----------------------------	-----------------	--------------------

This is the screen to reconcile from

Because Performance shows each rung of the ladder rather than only the headline, it is the right screen to open when your figure and someone else's disagree. Walk down the rungs together and the difference usually names itself: a discount treatment, a returns date, or tax.

▲ WATCH OUT

The most recent two weeks are provisional. Late orders, cancellations and refunds are still settling, so a fortnight-old figure will firm up. Do not read a dip at the right-hand edge of the chart as a trend.

Channels

- /channels
- CHANNELS
- SALES OPS
- ADMIN
- SUPER ADMIN

The same revenue cut by channel family, with a page per family so each can be read on its own terms.

WHAT IT'S FOR Per-channel performance.	READ OR ACT? Read-only.	WHO CHANNELS	FAMILIES Website, Amazon, Flipkart, Quick-comm, GT/MT, Long-tail, Other.
---	----------------------------	-----------------	---

Families, not individual channels

Channels are grouped into families so the pages stay readable and so marketing spend can be attributed sensibly. Long-tail covers Cred, Firstcry and Peeko; Quick-comm covers Blinkit, Zepto and Instamart.

 **IMPORTANT**

Read each family alongside *What Counts as a Sale on Each Channel*. Flipkart and GT/MT show **our sale to the buyer**, not consumer sell-through, so comparing them like-for-like against Website is comparing two different events.

Marketing

/marketing

CHANNELS

SALES OPS

ADMIN

SUPER ADMIN

Advertising spend by platform, alongside the revenue it sits against.

WHAT IT'S FOR Spend by platform, over time.	READ OR ACT? Read-only.	WHO CHANNELS	SOURCES Meta, Google, Amazon Ads, Amazon DSP.
---	---	------------------------------------	---

Sponsored and DSP are separate lenses

Amazon Sponsored and Amazon DSP are reported separately and **must never be added together**. They can target the same products, so summing them double-counts the same commercial activity.

⚠ WATCH OUT

Spend is platform-reported and revenue is order-reported, and they settle on different clocks. A same-day ratio of the two is noisy. Compare over a week or more.

Funnel

/funnel

CHANNELS

SALES OPS

ADMIN

SUPER ADMIN

Website conversion: sessions in, orders out, and the things that moved it.

WHAT IT'S FOR	READ OR ACT?	WHO	SCOPE
Website conversion rate.	Read-only.	CHANNELS	Website only.

Two session counts, deliberately

Sessions are available from both the analytics tag and the storefront itself, and the two never agree exactly because they count differently. Odo shows the conversion rate against both rather than picking a winner, so you can see how much of a change is real and how much is measurement.

NOTE

Recent days are provisional here too. Orders settle and session data is revised, so the last fortnight will move.

Stock markers

The timeline marks when a product went out of stock, because an unexplained conversion dip is very often an availability problem rather than a demand one. These markers are Website-scoped.

PART 5

Catalog

Per-product performance, margin, and stock.

Products

</products/drr>

CHANNELS

SALES OPS

ADMIN

SUPER ADMIN

Performance by product rather than by channel: what is selling, how fast, and where.

WHAT IT'S FOR	READ OR ACT?	WHO	SUB-PAGES
Per-product sales and run rate.	Read-only.	CHANNELS	Cross-channel, and P&L by product.

Cross-channel

Daily run rate per product across every channel, which is the view for spotting a product accelerating or dying without having to open each channel in turn.

P&L by product

Margin per product. It opens on Gross Margin across all channels; picking a single channel extends it through contribution margin, because fees and advertising only mean something once you know which channel you are talking about.

⚠ WATCH OUT

A product flagged **no cost** has no standard cost recorded, so its margin reads 100% and is wrong. Treat those rows as unknown rather than excellent. A handful of live products are currently in that state.

📌 NOTE

The **Account-level (unattributable)** row holds fees and spend that belong to the channel but pin to no single product. It exists so the columns still add up to the channel P&L, and it is never spread across products, because doing so would invent per-product costs.

P&L

/pnl/overall

SUPER ADMIN

The full profit and loss: revenue down to contribution, per channel and overall. This is the most restricted screen in Odo.

WHAT IT'S FOR	READ OR ACT?	WHO	GRAIN
Revenue through to margin.	Read, plus manual cost entry.	SUPER ADMIN only.	Monthly, by channel family.

The lines

GMV	Gross less discounts. The top of the P&L.
RTO and Refund	Goods that came back, split so an RTO is not double-counted against a refund.
Taxes	GST separated out.
COGS	Units multiplied by standard cost.
Logistics and Platform fee	Settlement-derived where a channel provides it, manually entered where it does not.
CAC	Advertising spend attributed to the channel family.
Brand marketing	Company-level cost, entered manually.
SG&A	Salary cost, fed automatically from Podium since 1 Sep 2026 — it is no longer typed in by hand. The basis is accrual on plan (each person's annual CTC ÷ 12), not cash actually paid, and the banner above the table names the basis and how many people are covered. Founder remuneration is deliberately excluded , so every SG&A and EBITDA figure on this page means "excluding founders".

 **IMPORTANT**

Standard cost is manual and can go stale. COGS is only as good as the last time somebody updated the cost table, and it has not been revised in several months. Check the cost basis before quoting a margin, especially a margin that looks unusually healthy.

⚠ DO NOT READ EBITDA FOR THE CURRENT MONTH

SG&A is charged as a full month on day one. The salary run is a whole month's cost, but the newest column only holds revenue *so far this month* — so early in a month the page shows a full month of salary against a few days of sales, and EBITDA looks catastrophic. On 1 September 2026 that read roughly **₹41 lakh** against a single day of revenue.

This is the agreed accounting convention, not a fault, and it corrects itself as the month fills. **Only compare SG&A and EBITDA against a completed month.**

⚠ WATCH OUT

Fees are dated to **settlement** while sales are dated to the **sale**. A month's fees can therefore trail its revenue. This is deliberate and consistent across the P&L screens, but it makes a single month's margin noisier than a quarter's.

Manual lines

Where a channel gives us no fee or logistics feed, the figure is typed in per month. A blank is genuinely blank, not zero cost, so a channel showing no logistics may simply be unentered.

Inventory

/inventory

CHANNELS

SALES OPS

ADMIN

SUPER ADMIN

Stock levels and out-of-stock history, so a sales dip can be checked against availability.

WHAT IT'S FOR	READ OR ACT?	WHO	UPDATES
Stock now, and when it ran out.	Read-only.	CHANNELS	Website every 5 minutes; Amazon hourly.

Watch and History

Watch is the current position. History is the record of when a product went out of stock and came back, which is what turns "sales fell" into "we had nothing to sell".

NOTE

Out of stock is confirmed across two consecutive readings rather than one, so a momentary blip during a restock does not register as an outage.

WATCH OUT

Stock alerting and the funnel stock markers are currently **Website only**. Amazon stock is captured but does not raise alerts, so an Amazon stockout will not notify anyone.

PART 6

Pipeline

Where the data comes from, and what to do when a number looks wrong.

Connectors

/connectors

SALES OPS

ADMIN

SUPER ADMIN

Every feed into Odo, its health, and the buttons to re-run it. This is the first screen to open when a number looks wrong.

WHAT IT'S FOR Feed health and manual re-runs.	READ OR ACT? Action.	WHO SALES OPS ADMIN	SCHEDULE Hourly, automatically.
--	-------------------------	------------------------	------------------------------------

What OK actually means

IMPORTANT

A green tick means "we checked this feed and the run succeeded". It does not mean data arrived. A channel that genuinely sold nothing shows green, correctly. So green plus a suspiciously flat chart is not a contradiction, and it is not proof the feed is fine either. Check the row count and the last sale date, not just the tick.

The buttons

- 1 Refresh.** Runs the feed now from where it left off. Safe to press: re-running a period cannot double-count.
- 2 Backfill.** Re-walks a longer history. Slower, for when a period needs rebuilding.
- 3 Disable.** Stops the feed running on schedule. Use sparingly, and remember it will then go stale silently.

Unmapped counts

Each connector shows how many product codes it has seen that Odo cannot identify. A rising count means revenue is being held out of the totals, so it is worth clearing. See *Mapping*.

Mapping

/mapping

SALES OPS

ADMIN

SUPER ADMIN

The queue of product codes a channel sent that Odo could not match to a product. Until they are resolved, those sales sit outside every total.

WHAT IT'S FOR	READ OR ACT?	WHO	EFFECT
Identify unknown channel SKUs.	Action.	SALES OPSADMIN	Resolving backfills history automatically.

Mapping one

- 1

Find the row. It shows the channel, the code the channel sent, the units and the value being held.
- 2

Search the variant. Type the product name and pick the exact variant.
- 3

Map. The history recalculates immediately, so past months change too.

 IMPORTANT

Do not guess a variant. Mapping to the wrong colour books real revenue against a product that never sold it, and because the fix backfills, the error backfills too. If a line does not name a colour and the product has more than one, ask the person who owns that channel.

 TIP

Most of the queue is zero-value: replacement, creator-shipment and spare-part codes that are deliberately never mapped. Sort by value and work the rows that carry money.

 WATCH OUT

An unfamiliar name is not always a new product. LOT has sold the same item under a different name on a different channel because margins differed. Check for an alias before assuming a SKU was never registered.

Uploads

/uploads

SALES OPS

ADMIN

SUPER ADMIN

Where the feeds that have no API get their data: a file, uploaded by hand.

WHAT IT'S FOR Manual data in.	READ OR ACT? Action.	WHO SALES OPSADMIN	RE-UPLOAD Safe: replaces, does not add.
----------------------------------	-------------------------	-----------------------	--

What gets uploaded

Quick-commerce sales come from the platforms' own seller reports, and courier freight invoices come in as a file. Both replace the period they cover rather than adding to it, so re-uploading a corrected file is the normal way to fix a mistake.

⚠ WATCH OUT

Upload the right period. A file covering a shorter window than you think will replace the period it covers, which can look like sales disappearing.

Dyno

/dyno

CHANNELS

SALES OPS

ADMIN

SUPER ADMIN

A working area for testing views and cuts of the data that do not yet have a home on a permanent screen.

WHAT IT'S FOR Exploration, not reporting.	READ OR ACT? Read-only.	WHO CHANNELS	STABILITY Changes without notice.
---	---	------------------------------------	---

⚠ WATCH OUT

Dyno is a sandbox. Views here can change or disappear, and they are not guaranteed to follow the definitions in this manual. **Do not build a recurring report on a Dyno screen.** If a cut here is useful enough to repeat, ask for it to be built properly.

PART 7

Admin

Access and channel configuration.

Admin

/admin

ADMIN

SUPER ADMIN

Who can open Odo, what each of them can see, and the per-channel settings that decide how a channel is counted.

WHAT IT'S FOR	READ OR ACT?	WHO	DEFAULT
Access and channel configuration.	Action.	ADMIN SUPER ADMIN	No role means no access.

Access

Odo's access list is its own. Granting someone a role here gives them nothing in any other LOT app, and their access elsewhere gives them nothing here. A role can be switched off with the active flag rather than deleted, which preserves the record of who had what.

IMPORTANT

Super Admin is the only role that can open P&L, and P&L carries cost, margin and staff cost. Grant it deliberately and rarely.

Channel settings

The setting that most affects the numbers decides **whether a channel's sales order is the revenue event**. Turn it on for a buyer who purchases outright, such as Flipkart Managed, General Trade or Peeko. Leave it off for a platform where we sell to the consumer and count the consumer order instead.

IMPORTANT

Getting that setting wrong **double-counts or hides an entire channel**. Turning it on for a platform we already count consumer sales from would count the same goods twice. If you are not certain which kind of channel it is, ask before changing it.
