PART 1

Getting Started

What Snorkel is, how to sign in, find your way around, and what your role can see.

Welcome to Snorkel

REQUESTER PROCUREMENT APPROVER FINANCE ADMIN

Snorkel is how Legend of Toys buys things. Whether you need a box of screws, a container of cars from China, or a new laptop, it starts here as a **request**, becomes a formal **purchase order**, gets approved and paid, and the goods arrive. Snorkel also runs our offline sales to shops and distributors, and keeps the register of everything the company owns. This manual is your self-serve guide to every screen in it.

What Snorkel covers

AREA	WHAT IT DOES
Requests & POs	The heart of Snorkel. Anyone asks for what they need; procurement turns it into a purchase order; it is approved, sent to the supplier, and paid.
Vendors & Reorders	The list of suppliers and freight forwarders that fills POs in automatically, plus quick requests to top up short-stock parts.
Payments	A queue of approved POs waiting to be paid.
Sales Orders	Orders to General Trade and Modern Trade shops: capture the order, hand it to dispatch, invoice it, and chase the money.
Assets	A register of what we own and rent: laptops, machines, furniture, where each one is and who has it.
Library & Admin	Our own company addresses (which print on every PO) and the roles that decide who can do what.

How a purchase moves

Almost everything on the buying side follows one path. Each stage has a different person responsible, so nothing big gets bought, approved and paid by a single pair of hands.

1. **Someone files a request.** Free-form: “I need 20 ceiling fans.” Any signed-in person can do this.
2. **Procurement turns it into a purchase order** with real vendors, quantities and prices. The PO starts as a **Draft**.
3. **Procurement accepts the PO.** This is procurement saying “this is right”: the PO becomes **Accepted** and the original request is marked approved.

4. **An approver gives final sign-off.** The PO becomes **Approved** and is ready to send to the supplier.
5. **Payment is routed and the PO is paid.** Either Finance pays it or the requester does; once done it is marked paid.

> ⓘ GOODS ARRIVE IN A DIFFERENT SYSTEM
>
> Snorkel's job ends when a PO is issued to the supplier. The actual **receiving** of goods (counting them in when the shipment lands) happens in our store system, not here. A PO that has been confirmed and is waiting for goods shows a reminder at the top of the Purchase Orders screen.

How to use this manual

Each chapter covers one screen and follows the same shape: what it is for, how to read it, and what to do. Jump to the screen you are on using the Contents page or your PDF reader's bookmarks. Chapters are tagged with the roles that use them:

REQUESTER PROCUREMENT APPROVER FINANCE ADMIN

Callout boxes

> ✓ TIP
>
> A faster or smarter way to do something.

> ⚠ WATCH OUT
>
> A common mistake or something easy to misread.

> ⛔ IMPORTANT
>
> Something that affects money, a supplier or a customer: get it right.

Signing In & Getting Around

REQUESTER PROCUREMENT APPROVER FINANCE ADMIN

Snorkel opens with one click using your work Google account, and everything is reachable from a sidebar grouped by what you do. This chapter covers signing in and finding your way around.

Signing in

Open `snorkel.legendoftoys.com` and sign in with your `@legendoftoys.com` Google account. Personal accounts are refused; if sign-in bounces you back, sign out of any personal Google account first or use a fresh browser profile. Your Snorkel account is the same login you use for our other systems, so there is nothing new to set up.

> ⓘ **YOUR ACCOUNT ALREADY EXISTS**
>
> People accounts are created once in our store system, not here. Snorkel only decides *what you can do* once you are in (see **Roles & What You Can See**). A brand-new person who has never been given a Snorkel role can still sign in and file requests.

The sidebar

The menu down the left is split into groups. You only see the groups and items your role allows, so your menu may be shorter than what is listed here. The sidebar keeps itself tidy: only the section you are currently working in stays open, and it follows you as you move around. Click any section header to open or close it; opening one closes the others.

GROUP	WHAT LIVES HERE
REQUESTS	PO Requests and New Request. Visible to everyone.
PROCUREMENT	Overview, Purchase Orders, Reorders, Vendors, Forwarders, New Product.
PAYMENTS	The Payment Queue.
OFFLINE SALES	Sales Orders, Collections, Partners, Channels.
ASSETS	Asset Register and its Categories & Locations settings.
LIBRARY	Addresses (our own company addresses).
HELP	This System Manual.

GROUP	WHAT LIVES HERE
ADMIN	Roles & Permissions and Users (managers only).

Click the Snorkel mark at the top (or the collapse button beside it) to shrink the sidebar to a slim icon rail when you want more room for a wide table; hovering an icon shows its label. Click it again to expand. Your name and role sit at the bottom, with a green dot that confirms the data on screen is live.

The top strip

A thin bar runs across the top of every screen. On the left it shows where you are (the area name, for example `PROCUREMENT`), and when an area has more than one screen it shows a small set of **tabs** so you can jump straight between siblings, such as Sales Orders, Collections and Partners, without going back to the sidebar. On the right, a `LIVE` dot confirms the screen is showing current data. The big screen title now sits inside the page itself, just above its summary cards.

Search anything

The search box at the top of the sidebar searches across the whole system at once, not just the screen you are on. Type a PO number, a vendor, a partner, a request, an asset and so on, and matching results appear grouped by type; click one to jump straight to it. **On a phone** the side rail is replaced by the tab bar at the bottom, so tap the **magnifying-glass icon in the bar across the top** to reach search there. Press the `/` key from anywhere to jump into that box.

Getting around a screen

Most screens open with the title and a row of **summary cards** (the headline numbers for that area), then the working table below. List screens carry their **filters** and a per-screen search in the panel header. Click a row to open it in detail. Many lists also have a **Refresh** button and an **Export** button that downloads exactly the rows you are currently looking at. The yellow code at the start of each row (a PO number, a request number, an asset code) is the item's permanent reference.

✓ TWO KINDS OF SEARCH

The sidebar search spans every kind of record and takes you to it. A search box *inside* a list panel is a quick filter on just that list: it matches across several columns at once (a PO's number, vendor, source and who raised it, for example), you can type more than one word to narrow further, it works alongside the dropdown filters, and the panel shows how many of the total rows currently match.

Roles & What You Can See

REQUESTER PROCUREMENT APPROVER FINANCE ADMIN

Snorkel gives each person exactly the access that matches their job in buying. The most important reason is the approval chain: the person who raises a purchase order is not the same person who gives it final sign-off, and a third hand routes the money. This chapter explains the five roles used throughout this manual and what each unlocks.

The five roles

REQUESTER	**Anyone at LOT.** Every signed-in person is at least a requester. They can file PO requests for things they need and follow what happens to them. No special access is required, and a person with no Snorkel role assigned is exactly this.
PROCUREMENT	**Procurement team.** Turns requests into purchase orders, raises and amends POs, and **accepts** them (the first sign-off). Also manages vendors, forwarders, reorders and new-product registration. Procurement does *not* give a PO its final approval.
APPROVER	**Approver.** Gives a purchase order its **final sign-off** after procurement has accepted it. This is the senior "yes, buy it" step.
FINANCE	**Finance.** Works the payment queue: routes an approved PO for payment (to Finance or back to the requester) and marks it paid.
ADMIN	**Manager / Admin.** Everything above, plus creating Snorkel roles and assigning them to people.

ⓘ ROLES ARE BUNDLES OF PERMISSIONS

Under the hood, each role is a set of switches: raise POs, accept POs, final-approve, route payment, manage vendors, manage company addresses, handle China POs, run offline sales, manage assets, and so on. The five tags above are plain-language groupings. Your manager can build a custom role with any combination of switches, so someone could (for example) raise POs and manage vendors but never approve. If you cannot do something you think you should, an admin needs to adjust your role on the **Roles & Permissions** screen.

The approval chain in plain terms

A purchase order moves through four named stages, and a different authority owns each handover:

STAGE	WHO MOVES IT	WHAT IT MEANS
Draft	PROCUREMENT	Just created. Still being shaped; can be edited or cancelled.
Accepted	PROCUREMENT	Procurement's "this is correct." Also marks the original request approved. Now printable and waiting for sign-off.
Approved	APPROVER	Final "yes". Ready to send to the supplier and to route for payment.
Payment	FINANCE	Routed to whoever pays, then marked paid.

THE RAISER CANNOT SELF-APPROVE A CHINA PO

For China purchase orders, the person who gives the final approval must be different from the person who raised it. This is a deliberate four-eyes check on our largest spend. China POs also hide their financial figures (prices, values, invoices) from anyone who is not cleared for China procurement.

Who sees what

AREA	REQ	PROC	APPR	FIN	ADM
File & track PO requests	•	•	•	•	•
Raise / amend POs, manage vendors		•			•
Accept a PO (first sign-off)		•			•
Final-approve a PO			•		•
Route payment & mark paid				•	•
Roles & user assignment					•

Sales Orders (the module for offline GT and MT sales) and the Asset Register have their own switches that an admin can add to any role, so the people who run those areas are often a different group from the buying team.

Who can actually pay: the money-authority model

This is worth stating plainly, because it is the recurring source of confusion:

- **Anyone at LOT** can raise a payment request.
- **Under ₹1,00,000** — Finance simply pays it. There is no in-system approval step.
- **₹1,00,000 and above** — needs **Vinay's** approval before Finance pays.
- **Finance means the specific people who can pay** — today, Mahesh and Priya. They are the ones who mark a request paid.

> ⛔ BEING IN THE FINANCE ROLE IS NOT THE SAME AS BEING ABLE TO PAY
>
> Paying is switched on for specific people, not handed out just by being in the Finance role. Someone can be in Finance and still not see a Mark-paid button, because that button is only offered to whoever is actually authorised to make payments. If you think you should be able to pay and cannot, ask an admin to check who currently holds that authority.

PART 2

Requests & Purchase Orders

From a free-form request, through the purchase-order approval chain, to a printed PO.

New Request

/requests/new REQUESTER PROCUREMENT APPROVER FINANCE ADMIN

A request is how you tell procurement what you need. It is deliberately free-form: you do not need to know vendors, prices or part numbers, just describe the thing. Anyone signed in can file one, and it is the front door to every purchase.

WHAT IT'S FOR	READ OR ACT?	WHO	RESULT
Asking procurement to buy something.	Act: you submit a request.	REQUESTER — anyone.	A numbered request (PR-).

Filling it in

Only two fields are required: a short **Title** and **Why do you need it?**. Everything else is optional but helps procurement act faster — and listing the items below is what stops this ending up back in a spreadsheet.

`Title` *	A one-line summary, e.g. "20× ceiling fans for the new floor."
`Why do you need it?` *	Context procurement can act on: what it is for, specs, links, any deadline behind the date below. This is *not* where the items themselves go any more — list those in the Items panel.
`Category`	A loose grouping (Office, Consumable, Component, Machine…).
`Suggested vendor`	If you know who to buy from, say so. Procurement decides the final supplier.
`Estimated cost`	Only shown while the Items panel is empty. As soon as you add a line, this field disappears and your total is worked out from the item rows instead.
`Urgency`	Low, Normal, High or Urgent. Urgent items stand out in the list.
`Needed by`	The date you need it in hand, if there is a deadline.
`Notes`	Anything else worth saying.

The Items panel

Below the request details is an **Items** panel where you list what you actually need, one row per item. Click **Add item** for a blank row, and the bin icon to remove one. A row you add and leave completely empty (no part, no description) is simply dropped when you submit — it will not block you or show up as an error.

`Item`	Search and pick a part code if one exists. Picking a part fills in the description and the tax rate for you — you never type an HSN code or a GST rate yourself. No part code for what you need? Leave it blank and describe it; procurement will confirm the rate for that line.
`Description`	Auto-filled from the part name when you pick one; edit or type it freely for an item with no part code.
`Qty & Unit`	How many, and in what unit (pcs by default).
`Est. price`	Your best guess at the unit price. A line with a quantity but no price is left out of the total, and the panel tells you how many lines that is.
`Tax`	Read-only. Filled automatically from the part you picked; shows a dash when no rate can be resolved.
`Line total`	Qty × est. price, updating as you type.

As you add lines, a running **Subtotal**, **Estimated tax** and **Estimated total** appear beneath the table. This is an estimate, not a quote: procurement still prices the purchase order.

> ⓘ MOST ITEMS WILL SHOW A DASH IN THE TAX COLUMN TODAY
>
> The tax column can only fill in what the part master already holds. As of this writing, an HSN code is set on a small fraction of active parts and fewer still resolve to a GST rate — so seeing "—" in Tax is expected for most lines, not a fault in the form. This is a data gap the team is closing, not something you need to work around: leave the field blank and move on.

Submitting

1. **Write a clear title and the "why."** These are the first things procurement reads.
2. **Add an item row for each thing you need,** picking a part where you can. Add cost, urgency and a needed-by date if you know them, so your request can be prioritised.
3. **Click Submit Request.** Snorkel gives it a number (like `PR-0142`) and opens the request so you can watch its progress.

✓ YOU DO NOT NEED TO KNOW HOW TO BUY IT

Leave vendors, HSN codes and GST rates to procurement if you are unsure. A good description of *what* and *why*, plus a rough item list, is far more useful than a guess at the supplier.

PO Requests

`/requests` REQUESTER PROCUREMENT APPROVER FINANCE ADMIN

The PO Requests screen lists every request that has been filed and where each one stands. It is the shared inbox between the people who ask for things and the procurement team who buys them.

WHAT IT'S FOR	READ OR ACT?	WHO	TABS
Tracking requests from filed to bought.	Read, with actions on each request.	REQUESTER PROCUREMENT ADMIN	All, pending, approved, rejected, cancelled.

Reading the list

Tabs across the top split requests by status, each showing a live count. Every row shows the request number, title, category, urgency, an **Items** count, estimated cost, who filed it, the date, and the status. When a request has been turned into a purchase order, its number appears under the **approved** badge so you can see what it became.

The **Items** column is how the list tells the two kinds of request apart at a glance: an itemised request shows how many lines it has, and a prose request shows a dash (—) instead, because it has none.

STATUS	WHAT IT MEANS
pending	Filed, waiting for procurement to act.
approved	Turned into a purchase order and that PO was accepted. The linked PO number is shown.
rejected	Procurement declined it, with a reason.
cancelled	The person who filed it withdrew it.

Opening a request

Click any row to open it. The detail screen shows everything that was filed and what can be done now, which depends on your role and the request's status:

- **Make PO from request** PROCUREMENT — starts a new purchase order with the request shown alongside. If the request has item lines, they prefill the PO's lines automatically (see New Purchase Order); otherwise copy the details across by hand.
- **Reject** PROCUREMENT — declines the request; a reason is required and is shown back to the requester.

- **Edit request** REQUESTER — shown to the person who filed it while the request is pending and procurement has not started a PO from it. It opens the same form; saving updates the request. If procurement has already started a PO, the screen says so and you must ask procurement to change it.
- **Cancel request** — only the person who filed it can withdraw their own pending request.

The linked purchase order

Once a PO has been raised, the detail screen shows a Linked Purchase Order panel. **Download PO** is offered there to the person who filed the request and to anyone with PO access. It opens the PO's print view; choose **Save as PDF** there. It is not offered for a cancelled PO.

PROCUREMENT If the request is edited while the PO form is open, saving the PO says the request changed and asks you to reload the page.

Reading a request's items

Any request filed with item lines shows an **Items** table on its detail screen: part code (or "new item" if none was picked), description, quantity, unit, estimated price, HSN, GST and a line total, with a subtotal, estimated tax and estimated total beneath it. A warning banner names how many lines have no tax rate resolved, so procurement knows which to confirm before turning the request into a PO. These prices are the requester's estimate, not a quote.

> ⓘ OLDER REQUESTS STILL READ AS PROSE
>
> Requests filed before item lines existed have no Items table — they show only the "What's needed" description, exactly as before. Nothing about them changed; the new table only appears once a request has lines.

> ⓘ ACCEPTING THE PO CLOSES THE LOOP
>
> A request is marked **approved** not when the PO is created, but when procurement *accepts* that PO. Until then the request stays pending and shows the draft PO it is linked to. This means a half-built draft will not falsely tell the requester their thing is on the way.

Procurement Overview

`/procurement` PROCUREMENT APPROVER ADMIN

The Procurement Overview is the buying team's home screen: a quick read on what is waiting, what is open, and what is arriving soon, with the two work queues right below. Start your day here.

WHAT IT'S FOR	READ OR ACT?	WHO	SHOWS
A snapshot of the buying pipeline.	Read; jump off into POs.	PROCUREMENT APPROVER ADMIN	Four counts + two short lists.

The four cards

CARD	WHAT IT COUNTS
Pending Requests	Reorder requests from the floor that nobody has actioned yet.
Open POs	Purchase orders still in flight — every status except Closed, Cancelled and Soft (so Draft, Pending Approval, Accepted, Approved, Sent, Confirmed & Payment Done and Partially Received all count).
To Approve	POs waiting on final sign-off — **Accepted** POs (accepted by the procurement manager, not yet given final approval), plus any still marked Pending Approval.
Arriving · 14d	POs whose expected arrival falls in the next 14 days, counting Accepted, Approved, Sent and Confirmed & Payment Done POs — Accepted included, because stock is already received against Accepted POs.

The **PO Pipeline** panel on the right counts POs by stage: **To Approve** (Accepted and Pending Approval — the same count as the card), **Approved**, **Sent**, **Confirmed** (Confirmed & Payment Done) and **Receiving** (Partially Received).

The two lists

Pending Reorder Requests shows the top short-stock items waiting to be bought, each with a **Convert →** button that starts a PO pre-linked to that request. **Open Purchase Orders** shows the most recent POs still in flight; click any row to open it. Both lists have a **View All** link to their full screen.

✓ CONVERT IS THE FAST PATH

If a reorder request is sound, **Convert** straight from here rather than starting a blank PO. The new PO remembers which request it came from, so the floor request is closed off automatically once you accept the PO.

Purchase Orders

`/procurement/pos` PROCUREMENT APPROVER FINANCE ADMIN

The Purchase Orders screen is the master list of every PO we have ever raised, across all categories and sources. It is where you find a PO to work, filter the pipeline, and spot anything stuck.

WHAT IT'S FOR	READ OR ACT?	WHO	FILTERS
Finding and tracking purchase orders.	Read; open a PO to act.	PROCUREMENT APPROVER FINANCE ADMIN	Status, source, type, vendor, a Raised-date range, plus search.

Reading the table

Each row shows the PO number, its revision number, type, source country, vendor, line count, value, the date it was **Raised**, its expected arrival, who raised it, and its current status. Click any row to open the PO; the **View** button on the right does the same. The status badge tells you where the PO is in its life:

STATUS	WHAT IT MEANS
Soft	A placeholder China PO for goods not yet pinned to a registered product.
Draft	Being built; can still be edited.
Accepted	Procurement has signed off; waiting for final approval.
Approved	Final sign-off given; ready to send and pay.
Sent	Issued to the supplier.
Confirmed & Payment Done / Partially Received / Closed	Later life stages once goods are flowing in.
Cancelled	Stopped, with a reason on the PO.

Filtering and finding

Use the search box to match a PO number, vendor, code, source, type or who raised it (type more than one word to narrow). The dropdowns filter by status, source country and order type; the status list now includes every status a PO can carry, including **Accepted**. The searchable **vendor** picker narrows to

one vendor at a time. The header shows how many rows match. **New PO** (top right, for procurement) starts a fresh purchase order.

Below the filter row is a **Raised** date filter, over the PO's own raised date: presets **Today · 7D · 30D · MTD · Last mo · FY · All time**, plus custom **from** and **to** dates. It opens on **All time** (deliberately, so an open PO raised last month is never hidden on load), so pick a preset or a custom range to narrow it.

> **Cross-checking a month's POs against a vendor?** Pick the vendor in the vendor picker, choose **MTD** or **Last mo** in the Raised filter, then use **Export + lines** — it carries **Qty Received** per line, so you can reconcile what was ordered against what has actually come in without opening each PO.

Downloading the list

The three KPI tiles above the table (Open value, Open POs, To Inward) and both export buttons all follow every filter above — search, status, source, type, vendor and the Raised date range — except **To Inward**, which is a fixed count of everything awaiting receiving and does not change with the filters. Two export buttons sit top right, beside New PO. Both work on *exactly what is on screen* — whatever the search box and the status, source, type, vendor and Raised-date filters are currently showing, in the same order — so clear the filters first if you want every PO.

BUTTON	ONE ROW PER	USE IT FOR
Export	Purchase order	The headers exactly as shown on screen: PO number, vendor, status, value and so on.
Export + lines	Line item	Working the detail of what was ordered in a spreadsheet: every line of every matching PO, each carrying its PO's header context.

Export gives you the headers you see on screen, plus the vendor code, the currency, an approximate rupee value for foreign-currency POs, the revision number, and the **Raised** date — the fields a spreadsheet is usually built to sort and total by. In the file, **Raised** is the **last** column (after Status), not where it sits on screen, so a spreadsheet built on the older column order still lines up.

Export + lines repeats the PO's header context on every row (PO number, revision, type, source, vendor, vendor code, status and expected date — it has no Raised column), then adds the line detail: Line No, Part Code, Description, Product, Variant, Colour, Qty Ordered, Qty Received, Unit, Unit Price, Total Value, HSN and GST %. It is what Procurement uses to work line-level detail (quantities, receiving, HSN/GST) in a spreadsheet rather than opening each PO in turn.

> China POs follow the same rule here as everywhere else, on **both** buttons: if you are not cleared to see China values, those rows arrive marked **Restricted** rather than carrying a number, and if you have no China PO access at all, Soft POs do not appear in the file. A restricted user's file cannot contain what their screen does not — the download can never contain more than your screen does.

If your filters match more POs than the screen has actually loaded, either button asks you to confirm before downloading, and marks the filename **PARTIAL** so you know at a glance it is not the full match.

> ⚠ **THE "AWAITING INWARD" BANNER**
>
> If POs have been confirmed but their goods have not yet been counted in, a yellow banner appears with a count and a link to the receiving screen in our store system. That receiving step happens outside Snorkel: Snorkel raises the order, the store counts it in.

> ⓘ **CHINA VALUES MAY SHOW AS "RESTRICTED"**
>
> If you are not cleared for China procurement, the **value** of a China-sourced PO shows as *Restricted* rather than a figure. You can still see the PO exists and track its status, just not its money.

Raising a PO

`/procurement/pos/new` PROCUREMENT ADMIN

Raising a purchase order is a guided, two-step flow: first pick the **category** of thing you are buying, then fill the form. The category sets sensible defaults (source country, currency, terms) and decides how you enter the lines, so you start most of the way there.

WHAT IT'S FOR	READ OR ACT?	WHO	RESULT
Creating a purchase order.	Act: you build and submit a PO.	PROCUREMENT ADMIN	A Draft PO (or a Soft China PO).

Step 1: pick a category

You land on a grid of cards. Each picks the order type and the right way to enter lines:

CARD	USE IT FOR
Full Products	Finished cars ordered at product level (by units, fully-built or knocked-down).
Components	Any parts across products: enter from a product's parts list, or type them in.
Packaging / Metal Parts / Electronics / Consumables / Para / Stickers	The same parts-list entry, but pre-filtered to just that kind of part.
Custom / Other	Free-form, type-it-yourself lines for anything ad-hoc.

There is also a separate **China PO** card, visible only to people cleared for China procurement. It forces China sourcing and the right currency and terms, filters the vendor list to Chinese suppliers, and unlocks the **Soft PO** option.

Step 2: fill the form

1. **Pick the vendor.** Choosing one auto-fills the currency, payment terms, source country and typical lead time from the vendor's record, so keep vendor records tidy.

2 **Add the line items.** Depending on the category you either tick parts off a product's parts list (quantities scale to the number of units), choose units of a finished product, or type lines in by hand. Every line you add shows in a running table with a live subtotal.
On the **From BOM** tab the parts list can be narrowed with the grey group buttons above it — **Main Unit** (the car, drone or train body), **Remote Only**, **Metal Parts**, **Accessories**, **Packaging**, **Para & Stickers** and **Consumables & Fasteners**. **Full Product** applies no filter and shows every part on the BOM.

> **If a part is not under any group button, use Full Product or the Manual tab — it is not missing.** SKD parts in particular are deliberately left off the group buttons: an SKD line is format-isolated, and this tab multiplies quantities by the number of units, so an SKD row on a normal product's checklist could show a quantity that is wrong for it. The **Manual** tab searches every active part regardless of group.

For **Full Products – By Units** (FBU or CKD), each row is Format, Variant, Colour, Product Qty, Remote Qty (only on products that have one), and an editable **Unit Price**. On an INR PO, Snorkel also shows read-only **HSN** and **GST %** columns pulled from the product master and the same HSN→GST table used on the Parts grid: you never type them. The unit price is **per product unit, remote included**, there is no separate price box for the remote; Remote Qty stays just a quantity on the line.

3 **Fill the shipping timeline.** Ready date, shipping date, mode, forwarder and transit days. Pick a forwarder and Snorkel fills the transit days for the chosen mode, then works out the expected arrival date for you.

4 **Choose the delivery address** (which of our company addresses the goods ship to). It defaults to the usual one.

5 **Click Create PO.** It is saved as a Draft, ready to be accepted.

> ⛔ **INDIAN POS NEED HSN AND GST ON EVERY LINE**
>
> For any PO priced in rupees, each line must carry an **HSN code** and a **GST%** before the PO can be printed. When you pick a part with a known HSN, Snorkel fills the GST rate for you and adds it into the running CGST/SGST or IGST totals. Foreign-currency POs have no GST block at all.

> ⓘ **THE PART MASTER WINS ON HSN (FROM 8 SEP 2026)**
>
> A line's HSN and GST still pre-fill from the part master. If you type a different HSN on a line, most people will see it quietly re-aligned back to the part master's code when the PO is raised or amended, only **Snorkel Admin, Finance or Procurement Manager** can correct a part's HSN by typing a new code on a line, and doing so updates the part master itself for every future PO. Anyone else's typed code is replaced and the attempt is logged. Before this, any typed HSN silently overwrote the part master for everyone.

⛔ A BY UNITS ROW WITH A QUANTITY NEEDS A PRICE (FROM 8 SEP 2026)

On an INR PO, submitting with a quantity but a blank Unit Price on a By Units row is refused: a toast names the row so you know which one to fix. Payments cannot be raised off a PO with no price and no GST (RULE-PO-001). The pre-submit totals panel now folds unit rows into the same subtotal and GST totals as the parts lines.

ⓘ SOFT POS ARE FOR UNNAMED CHINA GOODS

In China mode you can **Save as Soft PO** when you are ordering something that is not yet a registered product. The lines can carry free-text descriptions, and the PO is parked as *Soft* until the product is registered and the PO is promoted. Outside China mode this option does not appear.

✓ COMING FROM A REQUEST OR A REORDER

If you started this PO from a PO request, that request is pinned in a side panel so you can check against it; accepting the PO will mark the request approved. If the request has item lines, they prefill the PO's lines for you automatically, part code, description, quantity, unit and the requester's estimated price, however the category's line mode works. Every prefilled line stays fully editable: the price carried over is the requester's estimate, not a quote, and procurement still prices the PO. If you started it from a reorder request, the new PO is linked back and the reorder is closed when you finish.

ⓘ USE THE "CHARGE" ITEM TYPE FOR FREIGHT AND TOOLING (FROM 28 AUG 2026)

Line types now include **Charge**. Use it for anything the vendor bills that is not goods — shipping, transportation, die charges, tool charges, design plates.

A Charge line behaves like any other PO line: it still needs an **HSN/SAC code and GST %**, it still prints on the PO, and it still counts toward the PO total. The one difference is that **it is never sent to the store as something to receive**. Before this, a shipping charge appeared on the receiving screen as a quantity to count — one asked the floor to count 4,080 of "Shipping Charges".

If you find yourself typing a rupee amount into the **Qty** box to make the total come out right, the line should be a Charge: enter quantity 1 and put the amount in Unit Price.

Working a PO

`/procurement/pos/detail` PROCUREMENT APPROVER FINANCE ADMIN

The PO detail screen is the full file for one purchase order: its details, money, lines and history, and crucially the buttons that move it through the approval chain. The buttons you see depend on the PO's current stage and your role, so this screen quietly enforces who can do what.

WHAT IT'S FOR	READ OR ACT?	WHO	LAYOUT
Working a single purchase order.	The main action screen for POs.	PROCUREMENT APPROVER FINANCE ADMIN	Details & money · lines · history.

The layout

A header carries the PO number, its revision and status badges, and the action buttons. Below it: a **PO Details** panel (vendor, type, source, who raised and approved it, the shipping timeline, the delivery address) and a **Financial** panel (currency, terms, value, invoice). Then the **Line Items** table with a tax-aware total, and a **Revision History** of every change made. If the PO came from a request, a chip links back to it; if a payment has been routed, a chip shows its state.

Moving the PO along

The approval chain is a relay. At each stage only the right button appears, and only for someone with the right role:

1. **Accept** PROCUREMENT — on a Draft. Procurement's sign-off: the PO becomes **Accepted**, becomes printable, and the linked request is marked approved.
2. **Final Approve** APPROVER — on an Accepted PO. The senior "yes": it becomes **Approved**.
3. **Route payment** FINANCE — on an Approved PO. Request payment from **Finance** or from the **Requester**.
4. **Mark Paid** FINANCE — once payment has been made.
5. **Mark Sent** PROCUREMENT — records that the PO has gone to the supplier.

Two more buttons are available while a PO is live: **Amend** (edit the header, shipping details or line prices, with a required change note that is logged as a new revision) and **Cancel** (stop the PO, with a required reason). **Print PO** opens a clean, printable copy in a new tab. On the printed copy, a part line whose description does not already name its product shows **which product it belongs to** beneath it (e.g. "Manual" with "Wisp" under it), taken from the part master — so a vendor holding two manuals or

three licence stickers can tell them apart. On this page the same product appears in the **Product** column of the line table.

Amending line prices (from 8 Sep 2026)

The Amend modal carries a **Line Prices** table: # · Part code · Description · Ordered · Unit price. Use it to correct a price after the PO has already been issued.

1. **Click Amend.** Available on any live PO (not Cancelled, Closed or Soft).
2. **Edit the Unit price on any line.** Ordered quantity is shown but is not editable here, change quantities through Add Line or receiving instead.
3. **Type the change note** explaining why the price changed, then save.

Saving bumps the PO's revision by one, writes the old and new price for every changed line to Revision History, and the PO value recalculates automatically.

> ⓘ LINE PRICES IS HIDDEN WHERE YOU CANNOT SEE PRICES
>
> On a China PO, if you do not have the China-PO permission, the Line Prices table does not appear in Amend, matching the padlocked figures everywhere else on this screen.

> ⓘ A CLOSED PO WITH NOTHING RECEIVED CAN STILL BE CANCELLED (FROM 3 SEP 2026)
>
> Once a PO is **Closed**, the ordinary Cancel button disappears, exactly as before. But if *nothing was ever received against it*, a red **Cancel anyway** button appears instead. It opens the same cancel dialog, with a notice explaining the PO is Closed and eligible, and still requires a reason, which is recorded on the PO and in its Revision History.
>
> A Closed PO that HAS receipts stays a dead end on this screen: raise a return or a debit note instead of cancelling it. Before this button existed, cancelling such a PO meant asking for a direct database edit.

> ⛔ ACCEPT AND APPROVE ARE TWO DIFFERENT PEOPLE'S JOBS
>
> Acceptance is procurement saying the PO is correct; final approval is the senior sign-off to actually commit the spend. They are intentionally separate buttons held by separate roles. On China POs the approver must not be the person who raised the PO, four eyes on our biggest orders.

Changing the delivery address (from 8 Sep 2026)

The PO Details panel shows a **Delivery address** block (label and address line) under the shipping timeline, with a **Change** button next to it.

1. **Click Change.** Visible to anyone who can raise a PO, on every PO except Cancelled, Closed and Soft ones — **including POs that are already confirmed and paid** (China POs still need the China-PO permission). *Corrected 10 Sep 2026: until then the button was tied to whether the PO could still be Amended, so it was hidden on confirmed-and-paid POs even though the change was always allowed.*
2. **Pick a Ship to address** from the dropdown of the company's active addresses, then confirm.
3. **The PO updates immediately.** Picking the address it already has is a no-op: Snorkel tells you nothing changed and writes nothing. A deactivated address cannot be selected.

Unlike every other amendment on this screen, this one does **not** bump the revision number, raise a new PO number, or add a row to Revision History. Instead it is written to the **activity log**, recording the old and new address and who changed it. The reasoning: a new revision is a new commercial document that has to be re-sent to the vendor, and changing where we take delivery is not that, the vendor's copy of the PO is unaffected.

Reading the money

The line table totals up a **subtotal**, then the GST (shown as CGST + SGST for a supplier in our own state, or IGST for one in another state), then the **grand total**. If a supplier invoice value has been entered and it disagrees with the PO by more than a rounding amount, a red **MISMATCH** flag appears so it can be checked before paying.

ⓘ CHINA POS HIDE THEIR MONEY

If you are not cleared for China procurement, the financial panel and per-line prices on a China PO show as *Restricted* (a small padlock). You can still see and track the PO, just not its figures. This applies on this screen, the list, and the payment queue.

✓ EVERY CHANGE IS ON THE RECORD, EVEN THE ONE THAT SKIPS THE REVISION

You cannot quietly change a live PO. Most amendments bump the revision number and are logged in Revision History with who changed it, when, and the summary you typed. The one deliberate exception is the delivery address: it does not bump the revision, but it is still fully on the record — the old and new address are written to the **Garage activity log** against the name of whoever changed it. It will not appear in this PO's Revision History, so look there and not here. Where a change note is required, use it to explain *why*, not just what.

ⓘ USE THE "CHARGE" ITEM TYPE FOR FREIGHT AND TOOLING (FROM 28 AUG 2026)

Line types now include **Charge**. Use it for anything the vendor bills that is not goods — shipping, transportation, die charges, tool charges, design plates.

A Charge line behaves like any other PO line: it still needs an **HSN/SAC code and GST %**, it still prints on the PO, and it still counts toward the PO total. The one difference is that **it is never sent to the store as something to receive**. Before this, a shipping charge appeared on the receiving screen as a quantity to count — one asked the floor to count 4,080 of "Shipping Charges".

If you find yourself typing a rupee amount into the **Qty** box to make the total come out right, the line should be a Charge: enter quantity 1 and put the amount in Unit Price.

ⓘ THE PART MASTER WINS ON HSN (FROM 8 SEP 2026)

A line's HSN and GST pre-fill from the part master. When lines are added or the PO is amended, a line whose HSN disagrees with the master is re-aligned back to it, most people cannot make it stick by re-typing it. Only **Snorkel Admin, Finance or Procurement Manager** can correct a part's HSN this way, and their correction updates the part master for every future PO. Anyone else's typed code is replaced and the attempt is logged. See Raising a PO for the full rule.

PART 3

Vendors & Reorders

The supplier masters that feed every PO, plus shop-floor reorder requests.

Reorders

/procurement/reorders PROCUREMENT ADMIN

A reorder request is a lightweight “we’re running low on this” flag for a specific part or product. It is simpler than a full PO request and feeds straight into the buying pipeline: procurement converts the good ones into purchase orders.

WHAT IT’S FOR	READ OR ACT?	WHO	RESULT
Topping up short-stock items.	Raise requests; convert or reject.	PROCUREMENT ADMIN	A reorder request, then a PO.

Raising one

Click **New Request** and choose how to identify what you need:

- **By Part Code** — start typing to search the parts list; pick one and Snorkel shows its name, unit and **current stock** so you can size the order.
- **By Product** — choose a finished product and optional variant.

Then set the **quantity**, unit, an **urgency** (Normal, Urgent, Critical) and any notes, and submit. The request gets an ID and joins the list.

Working the list

The table shows every reorder request with its type, item, quantity, urgency, who raised it, date and status (Pending, Converted, Rejected). On a **Pending** request, procurement has two actions:

- **Convert →** — starts a new PO linked to this request; finishing the PO marks the reorder Converted and shows the PO number.
- **Reject** — declines it with a required reason, shown on the row.

✓ CHECK THE STOCK FIGURE BEFORE YOU SIZE THE ORDER

When you pick a part by code, the current stock appears next to it. Use it as a sanity check, ordering against a part that is actually full is an easy mistake to avoid here.

Moulds & Mould Orders

`/moulds` PROCUREMENT ADMIN

Some of our India-made plastic parts come from **moulds we own**: we hand a mould to a vendor, they injection-mould the parts (they buy the plastic too) and charge us one block price per shot. A single mould makes several different part codes at once, in a fixed ratio. **Moulds** lets you order the way the vendor understands (by mould number) while the store still receives the exact part codes.

WHAT IT'S FOR	READ OR ACT?	WHO	RESULT
Recording each mould and the parts it makes, so a mould can be ordered as one line.	Read for most; PROCUREMENT edits the mould map.	PROCUREMENT ADMIN	A one-line mould PO that the store receives part by part.

The idea in one line

You order **a number of shots** of a mould. Each part the mould makes has a **per-shot count**, so the store's expected quantity is simply *shots × per-shot count* for every part. Order 2,000 shots of a mould that makes 8 remote parts, and the store expects 2,000 of each part that is one-per-shot, 4,000 of a part that is two-per-shot, and so on. It works exactly like ordering a full car and having it break into its parts, only the recipe comes from the mould instead of a car's bill of materials.

The Moulds register

The list shows every mould we own: its number, a short description, the vendor who runs it, how many parts it makes, and whether it is active. Open one to see or edit two things:

SECTION	WHAT IT HOLDS
Details	Vendor (one vendor per mould), the default HSN, GST% and block rate per shot that pre-fill onto a PO, and the active switch.
Part map	The list of part codes this mould produces, each with its **per-shot count**. This is the recipe the store receives against.

To add or change a part, search for its code and set the per-shot count, then save the map. A part can appear in more than one mould (a mould-on-mould), which is fine.

Ordering a mould

1. **Start a PO as usual** and, on the lines, click **+ Add Mould Line** instead of a normal part line.
2. **Pick the mould and enter the number of shots.** The rate, HSN and GST fill in from the mould's defaults; you can override them. The whole mould is one line at one block price, which is exactly what the vendor sees.
3. **Check the "Will receive" preview.** Under the line, Snorkel lists every part the store will get and the quantity of each, so you can confirm the order is right before sending it.

> ⓘ THE VENDOR SEES THE MOULD, THE STORE SEES THE PARTS
>
> On the printed PO the line reads as the mould (for example "Mould 25306, Remote Control Parts, 2,000 shots"), because that is all the vendor needs. When the shipment arrives, the receiving screen automatically shows every constituent part code with its own expected quantity, so the store counts and books stock against the real parts. Nothing about receiving changes for the store team.

> ✓ COST STAYS AT THE MOULD
>
> The price lives on the mould line as one block cost. It is not split across the parts: the parts come in for stock only. So there is no need to work out a per-part price, which matches how the vendor bills us.

> ✓ ONE MOULD RUN IN TWO COLOURS IS TWO ENTRIES
>
> A few moulds are run more than once in different coloured plastic — the lights moulds are run once in clear and once in red — and the vendor charges a different rate for each run. Those are held as **two entries**, one per colour, suffixed `-T` for transparent and `-R` for red (for example `25316-T` and `25316-R`). Each entry carries only the parts made in that colour, and its own rate.
>
> Order the colour you are actually buying. If both were on one entry, receiving a clear run would also add the red parts to stock, which is how the store ends up holding parts that never arrived.
>
> **This means the register can show more entries than you have physical moulds** — two rows, one piece of steel. That is deliberate. Do not merge them back together, and do not count rows here to count tools.

> ⛔ A MOULD CAN ONLY ORDER THE PARTS IN ITS MAP
>
> If a part is missing from the map, it will not appear at receiving, so keep the map complete and the per-shot counts accurate. If a mould gains a new part, add it to the map; an arriving shipment can be refreshed to pick it up.

Vendors

`/procurement/vendors` PROCUREMENT ADMIN

Vendors are our supplier records. They are not just an address book: a vendor's details (currency, payment terms, country, lead time, GSTIN) auto-fill onto every PO you raise against them, so good vendor records make raising POs fast and correct.

WHAT IT'S FOR	READ OR ACT?	WHO	DRIVES
The supplier master behind every PO.	View all; manage with permission.	PROCUREMENT ADMIN	PO auto-fill & GST calculation.

The list

Each vendor row shows its code, name, category, **Process**, country, contact, default payment terms, typical lead time, and whether it is active. Search matches across code, name, category, country, contact and GSTIN. Anyone in procurement can view the list; the **New Vendor** button and the per-row **Edit** appear only for those who can manage vendors.

A vendor record

Identity	Name, category, source country, location.
Process	What this vendor *does* to the part: Moulding, Painting, Assembly or Other. Required when you create a vendor; you can leave it as-is when editing an existing one, which is why most vendors on file today are still unclassified.
Terms	Currency, default payment terms and typical lead time — these pre-fill the PO.
Contact	Name, phone and email.
GSTIN & address	The supplier's tax number and address. The GSTIN's state decides whether a PO is taxed as CGST+SGST or IGST.

A MOULDING VENDOR CANNOT BE SENT A PAINTED PART CODE

A moulding vendor makes the **unpainted** part. Mark a vendor as **Moulding** and Snorkel will refuse any purchase order to them that carries a painted part code, telling you the unpainted code to order instead. This only works for vendors you have classified, so set Process correctly when you create a moulding vendor.

Supplied items

Once a vendor is saved, you can record **what they supply**: by product, by part, or by PO category. This is what lets Snorkel suggest the right vendors when you raise a PO. Add an item by picking the reference and the PO category it belongs to.

THE GSTIN DRIVES THE TAX SPLIT

Whether a rupee PO is taxed as CGST + SGST (same state as us) or IGST (different state) is decided by the vendor's GSTIN. A wrong or missing GSTIN means the wrong tax on every PO to that supplier, so get it right when you create the vendor.

Forwarders

`/procurement/forwarders` PROCUREMENT ADMIN

Forwarders are the freight companies that ship our goods. Their main job in Snorkel is the **transit time**: how many days a shipment takes by sea, air or land. That figure is what lets a PO work out its expected arrival date automatically.

WHAT IT'S FOR	READ OR ACT?	WHO	DRIVES
The freight-forwarder master.	View all; manage with permission.	PROCUREMENT ADMIN	Expected-arrival dates on POs.

The list

Each forwarder shows its company name, country, the shipping **modes** it supports (Sea, Air, Land) and the typical days for each. Anyone in procurement can view; **New Forwarder** and **Edit** appear only for those who can manage masters.

A forwarder record

Identity	Company name, country, location.
Modes & transit days	Tick Sea, Air and/or Land, and give the typical number of days for each. These pre-fill onto a PO when you pick this forwarder and a mode.
Codes & tracking	IATA / SCAC codes and a tracking URL, if relevant.
Contact	Name, phone, email.

ⓘ HOW THIS SHOWS UP ON A PO

When raising a PO you choose a forwarder and a shipping mode; Snorkel fills the transit days from this record, then adds them to the shipping date to predict the arrival date. Keeping these day-counts realistic makes the whole pipeline's "arriving soon" view trustworthy.

New Product

`/products/register` PROCUREMENT ADMIN

New Product registration is how a never-before-seen product gets into our systems so it can be ordered, built and sold. You register a whole **family** (a product and its colour/model variants) in one go, and each variant is handed a fresh barcode. This is a specialist screen, limited to people cleared for China procurement and new products.

WHAT IT'S FOR	READ OR ACT?	WHO	RESULT
Registering a new product family.	Act: you create product records.	PROCUREMENT ADMIN (China-cleared)	A product family + barcodes.

Two modes

- **New family** — register a brand-new product from scratch: its name, a code prefix, what kind of thing it is (car, drone, accessory), how it is received (built-up, knocked-down, or either), and whether it comes with a remote.
- **Extend** — add new variants (a new colour, say) to a product family that already exists. Pick the family and the base details fill in to keep everything consistent.

Adding variants

1. **Set the base details** (name, type, receive format, has-remote).
2. **Add a row per variant** with its model, colour, SKU and product code. Codes and SKUs must be unique within the batch.
3. **Add the remote** (its own SKU and code) if the product has one, on a new family.
4. **Submit.** Each variant is assigned a barcode from the pool and the family is created.

> ⚠ WATCH THE BARCODE POOL
>
> A counter at the top right shows how many barcodes are available. Each new variant consumes one. If the pool is too low for the number of variants you are registering, the form blocks you and asks for more to be loaded first. It turns amber when it is getting low.

> ⓘ WHERE THE "SOFT PO" LOOP CLOSES
>
> Registering a product here is what lets a placeholder **Soft** China PO be promoted to a real one: once the goods have a registered product to point at, the PO can stop being a placeholder.

PART 4

Payments

Asking Finance to pay someone, approving it, and paying it.

Raising a Payment Request

/payments/new REQUESTER PROCUREMENT FINANCE APPROVER ADMIN

Raising a payment request is how you ask Finance to pay someone. It replaces posting in the **#payments** Slack channel — and unlike a chat message, you can see what happened to it afterwards without asking anyone.

What it's for Asking Finance to pay a vendor, influencer, ad platform, landlord or anyone else.	**Read or act?** Act: raise the request.	**Who**Everyone at LOT.	**Works on a phone**Yes — including photographing the invoice.

Filling it in

1. **Payee** — search for who is being paid. Vendors are already here. If they are missing, tap **+ New** and add them once; nobody has to paste bank details into a chat again. Use the name on the invoice, not the person you deal with.
2. **Category** — what kind of spend it is. Some categories need a PO (see below).
3. **What is this for** — one line, in plain words. "Acrylic sheets for Shadow tooling", not "payment".
4. **Invoice** — tap **Take photo** to shoot it there and then, or **Upload file** for a PDF or something in your gallery. Attach as many as you need.
5. **Amounts** — the invoice total, then what to pay *now*. If you pay less than the total, the rest is shown as the balance left on that invoice, and a later request against the same invoice number will say what has already been asked for.
6. **Needed by** — a real date. This is what Finance sorts the queue by.
7. **Note for Finance** — optional. Free text for anything Finance needs to pay this, typically the payee's bank details, account name or UPI. It is plain text, up to 2,000 characters, and is visible to Finance and any approver on the request.

Some categories need a PO. Material, Packaging, Outsourcing and Equipment all require a purchase order number, because the PO is what makes the spend traceable. If you do not have one, raise it under **Procurement → Purchase Orders** or ask the procurement team, then come back. The form will tell you this rather than just refusing.

A CANCELLED PO WILL NOT BE ACCEPTED

The PO you link has to be a live one. If it has been **cancelled**, the form refuses the request and says so — a cancelled PO no longer exists as a commitment, so nothing can be paid against it. Link a live PO instead, or pick a category that does not need one.

A **Soft** or **Closed** PO is allowed but you will get a note after raising, because a Soft PO is not committed yet and a Closed one is already settled — worth a second look that it is the PO you meant.

If the request takes the PO past its own value, you will see that too, with what has already been requested against it. That is *not* a refusal — advances, part-payments and a vendor billing over the PO are all normal. It is there so it is a decision rather than a surprise for Finance. (The check is skipped when the PO and the payment are in different currencies, because the two figures cannot be compared.)

What happens next

Requests at or above the approval threshold go to an approver first. Below it, they go straight to Finance. Payments in a currency other than rupees always go for approval, because the threshold is a rupee figure and cannot be applied to another currency.

You can follow it under **My Requests**, and you will be told when it is approved, rejected or paid — a rejection always carries the reason, and a payment carries the UTR. Finance can also put an approved request **on hold** if something needs sorting out before it is paid — a reason is required and you will see it. This is not a rejection: the request stays open in your list as **"On hold with Finance"** until Finance releases it, and you can still cancel it while it is held.

My Requests is split into tabs — **All · Submitted · Approved · Paid · Cancelled** — each with its count. The **Value** figure on the All tab counts *active* requests only: anything cancelled or rejected is left out, so the headline never overstates what is still owed. Open the Cancelled tab to see what was cancelled and its value; it stays there for tracking and never mixes into the active figure. Value is in rupees; requests in another currency are counted separately rather than added in.

EXPORT PAID PAYMENTS, FOR TALLY

Approvers, Finance and Admins see an **Export paid payments** panel above the list: pick a date range and tap **Export CSV**. It carries **paid requests only** — vendor, invoice details, amount, payment date, the UTR or reference, and any TDS deducted, including two columns just before "TDS %": **GST % (TDS)** and **Taxable value (TDS base)**, the GST rate and the ex-GST amount the TDS was calculated on — for updating Tally and reconciling vendor ledgers and bank entries. Both are blank on a row with no TDS, and blank on a payment made before this pair of columns existed. The last column, **Open in Snorkel**, is a link to each request's page, where its uploaded invoice and documents open — a link into Snorkel rather than to the file itself, so it keeps working and only opens for people allowed to see the request.

The range defaults to **today**, so straight after opening it will often say "0 payments in this range" until you widen it. That is expected, not a fault.

Raised something by mistake? Open it from My Requests and cancel it. Anything not yet paid can be cancelled by whoever raised it.

ⓘ FORGOT THE INVOICE, OR IT DID NOT ATTACH? ADD IT AFTER THE FACT

Open the request and use **+ Attach invoice** in its Documents panel. You (as the person who raised it) can add one to your own request, and so can Finance, right up until it is cancelled or rejected. This replaces the old fix of cancelling and re-raising the whole request just to get the invoice on file — which is also why the same invoice used to show up two or three times.

All Requests

`/payments/all` FINANCE APPROVER ADMIN

All Requests lists every payment request raised by anyone, in every status, so you can see where a payment has got to without asking around. It is view only.

What it's for Seeing every payment request and its status.	**Read or act?**Read only: no approving or paying here.	**Who**Finance, plus anyone who can approve or pay.	**Where**Payments, next to My Requests.

Who sees it

The Finance role (Finance Manager) sees All Requests, and so does anyone who holds an approve, pay or super-admin payment permission. If you do not have one of these, the entry is not in your menu; you still see your own requests under My Requests.

Using the list

The status tabs work exactly as they do on My Requests, so you can narrow to pending, approved, paid, rejected or cancelled. Click a row to open the request and see its invoice.

View only. Approving still happens on Approvals and paying still happens on the Finance Queue. There are no tick boxes or bulk buttons on this page.

If the list fails to load you will see an error, not an empty list. An empty list means there really are no requests; an error means try again.

Approvals

`/payments/approvals` APPROVER ADMIN

Approvals is where payment requests at or above the threshold wait for a decision. Nothing below the threshold appears here — those go straight to Finance.

What it's for Approving or rejecting larger payments.	**Read or act?**Act: approve or reject.	**Who**Named approvers only.

Working the queue

Each row shows the payee, the amount, what it is for, who raised it, when it is needed, and the PO if the category requires one. Tick several and approve them together, or open one to see the invoice before deciding.

A rejection needs a reason, and the reason is the message. Whoever raised the request sees exactly what you write, so say what would make it approvable. "Rejected" on its own sends them back to chat to ask why, which is the thing this system exists to stop.

Approving is not paying. An approved request moves to the Finance queue; the money does not leave until Finance marks it paid and records the UTR.

Finance Queue

`/payments/finance` FINANCE ADMIN

The Finance Queue is the worklist for actually paying. Everything approved and unpaid is here, most urgent first, with the payee's bank details on the card so you do not have to go looking for them.

What it's for	Making the payments and recording them.	**Read or act?**	Act: mark paid, record the UTR.
Who	Finance.	**Order**	Urgent first, then by needed-by date.

Each card carries

- The amount, what it is for, and who asked.
- The **bank account** — account number, IFSC, bank and UPI where held, each with a copy button.
- The requester's **Note for Finance**, directly under the bank block, when they left one — free text, usually more bank details, an account name or a UPI.
- The invoice, openable in one tap.
- Whether it was approved by someone, or fell below the threshold.

Paying

1. Make the payment in your bank.
2. If tax was deducted at source, enter the **TDS rate (%)** on the card. A **GST %** picker (0 · 5 · 12 · 18 · 28) appears beside it — check it matches the invoice and change it if not. The taxable value, the deduction and the resulting net are calculated and shown live as you type.
3. Put the UTR or reference in the box on the card.
4. Tap **Mark paid**.

The person who raised it is told immediately, with the UTR. That is what stops the "is it done?" messages.

ⓘ TDS IS ENTERED BY FINANCE, NOT THE REQUESTER

The **TDS rate (%)** field lives on this card, at the point of marking paid — the person who raised the request never sees or enters it; they only upload the invoice and its details. TDS is computed on the invoice's **taxable value** (the amount before GST), not the invoice total: typing a rate opens a **GST %** picker (0, 5, 12, 18 or 28) next to it, pre-filled from the linked PO's GST rate, else the rate the vendor's POs are always raised at, else 18% if the payee has a GSTIN on file, else 0% — change it if the invoice says something different. Taxable value = invoice total ÷ (1 + GST%); TDS = taxable value × the TDS rate. The preview under the fields shows the taxable value, the TDS amount and the net payable as you type. A TDS rate cannot be entered without a GST rate — Snorkel refuses the payment until one is picked. The **amount released is net of TDS**, and the **Amount Paid** field defaults to that net figure, so what you record as paid already has the deduction taken out. Once paid, the request shows the taxable value it was calculated on alongside the GST % used, so the figure can be checked later.

Leaving the rate blank means TDS does not apply to this payment — it is not the same as entering 0. A payment with no TDS looks exactly as it always did: full amount, no deduction shown.

If one invoice mixes GST rates across its lines, pick whichever rate dominates the invoice, or pay without TDS here and adjust the deduction in Tally instead.

⚠ AN INVOICE PAID IN INSTALMENTS — CHECK BEFORE ENTERING TDS AGAIN

The rate is applied to the **full invoice's taxable value**, not to the instalment being paid. If the same invoice (same payee and invoice number, or the same PO and invoice total) already had TDS deducted on an earlier payment request, an amber note appears under the TDS field listing that deduction — request number, amount, rate and date. Entering a rate again deducts the full-invoice TDS a second time and the vendor is paid short, so leave it blank unless Finance has decided otherwise. Snorkel warns but does not stop you; the same warning pops up if you mark it paid anyway.

ⓘ YOU CAN REJECT A REQUEST YOURSELF

If the invoice is wrong — wrong amount, wrong vendor, already paid — open the request and use **Reject**. You no longer have to send it back up for someone else to reject it. A reason is required, and the person who raised the request sees exactly what you wrote, so write something they can act on: "invoice is for 4,484 but the PO says 4,048" beats "wrong".

ⓘ PUTTING A REQUEST ON HOLD

Not ready to pay something — waiting on a corrected invoice, a budget check, whatever it is — without rejecting it? Use **Hold** on the card, or **Put on hold** on the request page. A reason is required and the requester sees it. This is a pause, not a closure: the request stays open on their side as **"On hold with Finance"**, it drops out of the To-pay total, and it moves to an **On hold** section below the queue with who held it, when, and why. Use **Release** to bring it back to the ready-to-pay list — it has to be released before it can be marked paid. You can also **Open** a held request and use **Reject** on its page, and the requester can still cancel it themselves.

ⓘ ONLY THE PEOPLE WHO ACTUALLY PAY SEE THE UTR BOX

The UTR field, the **TDS rate (%)** field, the **GST %** picker and **Mark paid** button only appear editable for whoever is authorised to make the payment. Everyone else who can open this queue — managers and super admins included — sees “View only — payments are marked by finance.” instead, with the rest of the card (bank details, invoice, amount, and any TDS already recorded) still visible read-only. Being in the Finance role is not by itself enough to pay; that is granted to specific people so the button is never offered to someone it would just reject.

No bank account on file? The card says so instead of letting you pay blind. If the requester left a **Note for Finance**, the warning points you to it — check there before chasing anyone in chat. Otherwise, add the account under **Payees** — once. Bank details are visible to Finance only.

Creator Payments from Ignition

FINANCE APPROVER ADMIN

Some payment requests do not come from a person in Snorkel. They are raised by the influencer team from a deal in Ignition. They land in your normal queue and are paid the normal way; the difference is where the details come from and where the answers go.

What it's for Paying creators for Ignition deals.	**Read or act?** Act: hold, reject, pay, as usual.	**Who** Finance.	**Raised by** The deal owner, in Ignition.

What arrives

- An ordinary request with the next PAY number, category **Influencer**, no PO.
- The **creator's own invoice is attached**. A request is only sent once the invoice is there, so you never get one without it.
- The **payee is found or created for you** from the creator's contract: matched on PAN, then name, so an existing influencer payee is reused and not duplicated. The bank details are the ones the creator entered on the contract page.
- An advance and its balance can be two requests on the same invoice number. The duplicate-invoice warning will show; that is expected.

Approval

The usual threshold applies. Creator requests under ₹5,00,000 normally go straight to **Approved**. Over that, they wait for an approver as any request does.

Hold and reject: write for the deal owner

When you **hold** or **reject** one of these, the deal owner gets a Slack message with your reason, word for word, and sees it on the deal. They are not in Snorkel and cannot ask you what you meant. So say what is wrong and what to do ("Invoice total does not match the fee. Upload the corrected invoice and raise again"), not just "wrong". A reason is needed in any case. Hold, release and hold again messages the owner each time.

Marking paid

Mark paid as always: TDS rate if it applies, amount, UTR. The deal is updated straight away with the **date, amount, UTR and TDS**, and shows Paid. The amount the deal shows is the gross: what you paid plus TDS. If you fix the UTR later, the deal picks up the change within about 15 minutes.

Monthly commission requests

For affiliate creators, Ignition also sends a **commission request** once a month. It goes through exactly the same path as a fee payment: same queue, same bank details, same hold and reject, and the UTR and TDS go back to Ignition when you mark it paid.

- **How to recognise one:** the purpose reads "deal number · commission YYYY-MM · @handle". Fee requests say advance, balance or full instead.

- **The amount is already checked.** It is exactly what the D2C team verified for that month in Ignition. You never change it.
- **One per deal per month,** and each comes with that month's commission invoice from the creator.
- **What to check:** the invoice is for that month's commission (not a fee or another month), and its total matches the request amount.
- **If you reject it,** the deal owner is told your reason as usual, and D2C can raise it again from Ignition once fixed. A cancelled one can be raised again the same way. So say what to correct.

> ⓘ **IF IT IS CANCELLED**
>
> The owner can cancel a request in Ignition only before it reaches Snorkel. Once it is in your queue, only you cancel or reject it, and the deal shows the new status.

Payees

/payments/payees REQUESTER PROCUREMENT FINANCE ADMIN

Payees are everyone LOT pays: vendors, influencers, ad platforms, landlords, event organisers, professional services. It is deliberately wider than the vendor list.

What it's for One record per person or company we pay.	**Read or act?**Both: look up, and add new ones.	**Who**Anyone can add a payee; only Finance can read bank details back.

Vendors arrive here on their own. Every procurement vendor is already a payee, and a new or renamed vendor updates automatically. You never need to add a vendor here by hand.

Everyone else has to be added once. Influencers, ad platforms, utilities and event organisers have no vendor record, so the first time you pay one, add them from the request form with **+ New**. After that they are in the list for everybody.

Bank details

You can enter an account when you add a payee — you usually have it in front of you. You cannot read one back unless you are Finance; everyone else sees only the last four digits. That is deliberate: it means bank details stop travelling through chat without putting them on general view.

Notifications

`/payments/notifications` REQUESTER PROCUREMENT FINANCE APPROVER ADMIN

Notifications tell you when something involving you has moved, so you do not have to go and check.

What it's for Knowing what happened without asking.	**Read or act?**Read; tap through to the request.	**Who**Everyone.

What you will be told

- **If you raised it** — when it is approved, put **on hold** (with the reason), released and **back with Finance**, rejected (with the reason) or paid (with the UTR).
- **If you approve** — when something needs your approval.
- **If you are Finance** — when something is ready to pay.

Unread items are marked with a dot. Tapping one opens the request and marks it read.

PO Payment Queue (superseded)

`/payments/po-queue` FINANCE PROCUREMENT ADMIN

The PO Payment Queue covers purchase orders that were already routed for payment the old way. It is **superseded by Payment Requests** — raise new payments there, and use the Finance Queue to pay them. This page is kept only for POs already in flight.

WHAT IT'S FOR	READ OR ACT?	WHO	TABS
Getting approved POs paid.	Act: route and mark paid.	FINANCE PROCUREMENT ADMIN	To Route, Requested, Paid, All.

Reading the queue

Tabs split the approved POs by payment state, each with a count:

TAB	WHAT IT HOLDS
To Route	Approved POs whose payment has not been requested from anyone yet.
Requested	Payment has been routed (to Finance or the requester) and is awaiting the money.
Paid	Done, showing who marked it paid and when.
All	Everything together.

Each row shows the PO, vendor, value, when it was approved, and the payment state. Click the PO number to open the full PO.

Working a payment

1. **On a To-Route PO, choose who pays: → Finance** (the finance team pays) or **→ Requester** (the person who asked pays and claims it back). The PO moves to Requested.
2. **When the money has gone out, click Mark Paid.** The PO moves to Paid and is stamped with your name and the date.

> ⓘ THE SAME BUTTONS LIVE ON THE PO TOO
>
> You can route and mark-paid from a PO's own detail screen as well; this queue just gathers them all in one place so finance can work down the list. Only POs that have been fully **Approved** appear here, never drafts or accepted-but-not-approved ones.

PART 5

Sales Orders

Selling to General Trade and Modern Trade: orders, dispatch handoff, invoicing and collections.

Sales Orders

/sales/orders PROCUREMENT FINANCE ADMIN

Sales Orders is the sell-side of Snorkel: orders to our offline channels, General Trade and Modern Trade shops and distributors. An order is captured as a draft, confirmed (which hands it to the dispatch team), invoiced, and then collected against. This screen is the worklist of all of them.

WHAT IT'S FOR	READ OR ACT?	WHO	TILES
Offline (GT / MT) sales orders.	Read; open an order to act.	SALES FINANCE ADMIN	Open, to-dispatch, overdue, FY sales; PO and fulfilled value.

The tiles and list

Four tiles head the screen: **Open orders**, the value still **to dispatch**, the **overdue** balance (click it to filter to just overdue), and total sales this financial year. The table below shows each order's number, date, partner, channel, status, fulfilment, total, **fulfilled value**, outstanding balance, due date and payment state. Search and the status / fulfilment / channel filters narrow it; **Export** downloads what you see, one row per order, ending with the partner's own PO reference (**Partner PO Ref**); **Export + lines** downloads the same filtered orders with **one row per line item** — order, partner code and GSTIN, Partner PO Ref, invoice, then each line's product, model, colour, SKU, HSN, qty, rate, discount, taxable value, GST and line total.

Date filter. Above the table, preset buttons (**Today**, **7D**, **30D**, **MTD**, **Last month**, **FY**, **All time**) or a custom **From → To** narrow the list by **order date**. It starts on **All time** so no open order is hidden, applies to the table and to all three exports (**Export**, **Export + lines**, **SKU to send**), and is remembered for as long as the browser tab stays open. When a date range is set, it is added to every export's file name.

Value tiles. Two more tiles sit under the four. **Total PO value** is the sum of order totals, what the partner ordered. **Total fulfilled value** is the ₹ actually despatched including GST; it is not invoiced and not collected money. Its subtitle shows the percentage of PO value, or warns that some orders' dispatch data could not be read (those orders are not counted). Both tiles count **confirmed orders only** (drafts and cancelled are left out) and follow the channel and status filters and the date range. They ignore the search box and the fulfilment and overdue chips. The original four tiles do **not** follow the date range.

Export + lines ends with two extra columns: **Order Fulfilment** (the order's fulfilment status, as in the list badge) and **Line Status** for that line: *Shipped*, *Part shipped*, *Packed*, *Part packed* or *Not shipped*. Line Status is blank for draft or cancelled orders, or when dispatch data could not be read. The existing columns are unchanged and in the same positions.

The **Fulfilled** column is the money that has actually shipped, priced at each line's own rate, sitting beside the order total so the two can be read against each other. Where an order is short, the gap shows underneath it in red. This answers the question units never could: three missing remotes and three missing cars are the same shortfall in units and very different amounts of money, and it is the money that decides whether a follow-up is worth making. A cancelled order shows a dash — there is no gap to chase. Both figures are in the CSV export.

> Like the per-item Sent and Pending columns, this counts what dispatch actually packed and sent — never what was planned — so an order packed short shows the short figure.

An order's life

STAGE	WHAT IT MEANS
Draft	Being built. Freely editable. Not yet seen by dispatch.
Confirmed	Locked and handed to dispatch (a fulfilment request is raised for them). Can now be invoiced.
Cancelled	Stopped, with a reason. A request the dispatch team rejects also lands the order here.

Separate from that, a **fulfilment** label (Not submitted, Awaiting acceptance, In fulfilment, Partially fulfilled, Fully fulfilled, Rejected) is read straight from the dispatch side, and a **payment** label (Unpaid, Partial, Paid) reflects collections. The Fulfilment & tracking chapter explains the fulfilment labels in full.

> ⛔ CONFIRMING HANDS THE ORDER TO DISPATCH
>
> Confirming an order is a one-way handoff: it locks the lines for editing and raises a fulfilment request that the dispatch team works in Depot. After that, the fulfilment status here is **read from** that request and its shipments, you do not set it. Get the order right before you confirm.

> ⓘ DISPATCH HAPPENS IN DEPOT
>
> Once an order is confirmed, the dispatch team picks up its fulfilment request in Depot and ships it, in one delivery or several. Courier tracking, dispatch and delivery dates flow back here on their own and drive the payment-due clock. Nothing about boxes or scans lives in Snorkel. See Fulfilment & tracking.

Creating and working an order

New Order opens a form: pick the partner and channel, set the order date and credit days (these default from the partner), and add lines (product, model, colour, quantity, rate, discount and GST). It saves as a Draft. Open any order to work it; the buttons follow its stage:

1. **Edit a draft.** Change its lines or details. Disabled once confirmed or invoiced.
2. **Confirm and hand to dispatch.** Locks the order and raises its fulfilment request for the Depot team. You are asked to confirm because it is one-way.
3. **Generate the invoice.** On a confirmed order, mints the GST tax invoice and opens it to print. The number is permanent.
4. **Record a receipt.** In the Collections panel, log a payment (amount, date, mode, reference). Partial payments are fine, and the balance and payment state update themselves.
5. **Cancel the order.** Stop a draft or confirmed order, with a reason.

Seeing what has actually shipped

Once an order is confirmed, its items table gains two columns: **Sent** and **Pending**. These are per item, so on a partly-fulfilled order you can see exactly which products have gone and which are still owed — the order-level *Partially fulfilled* badge tells you that something is outstanding, these columns tell you *what*. Anything still outstanding shows amber.

Where stock has been packed but has not left yet, it is called out beside the Sent figure as *"+n packed"* rather than folded into either column — it is neither dispatched nor still to be picked, and a follow-up with the partner should say so.

> These columns are read from what dispatch actually packed and sent, not from what was planned. An order that was packed short will show the short figure, which is the point.

Order notes are visible everywhere they matter. The Notes field on an order (delay instructions, special requirements) shows in an amber **Order notes** box on the order's Status panel — you no longer have to open Edit details to read it — and the same text appears on the fulfilment request the Depot team sees, so instructions typed here actually reach dispatch.

> **ONE INVOICE PER ORDER, AND IT IS FINAL**
>
> Generating the GST invoice requires the order to be confirmed and every line to carry an HSN code. The invoice number is permanent and continuous for the financial year, so it cannot be re-generated and the lines freeze once invoiced. The tax splits into CGST + SGST when the partner is in our own state, or IGST when they are in another, worked out from the partner's and our own registered GST details.

Fulfilment & tracking

/sales/orders PROCUREMENT FINANCE ADMIN

When you confirm a sales order, Snorkel does not ship it. It raises a fulfilment request that the dispatch team in Depot picks up. They decide how to fulfil it, in one delivery or several, add courier tracking as it moves, and all of that flows back onto your order on its own. This chapter explains what happens after Confirm, so the labels you see on an order make sense.

WHAT IT IS	WHERE	WHO	YOU SEE
What happens after you confirm an order.	You confirm in Snorkel; Depot fulfils.	SALES FINANCE ADMIN	Fulfilment status & tracking, read-only.

From confirm to delivery

1. **You confirm the order.** Snorkel raises one fulfilment request for the whole order and hands it to the Depot dispatch team. The order is now locked for editing.
2. **Depot accepts or rejects it.** The dispatch team sees the request in their queue. They either accept it and start preparing the goods, or reject it with a reason.
3. **They ship it, in one or more deliveries.** An accepted request can go out as a single full shipment, or be split into several shipments that each leave on their own date.
4. **Tracking flows back.** As each shipment is dispatched, Depot records the courier, tracking number and dates. You see all of it on the order without doing anything.

Full or split

DEPOT CHOOSES	WHAT IT MEANS FOR YOU
Full	The whole order goes out as one shipment. Once it ships, the order is fully fulfilled.
Split	The order goes out in several shipments, each with its own scheduled date and quantities. The order stays partially fulfilled until the last one ships.

The fulfilment labels

The fulfilment column on the Sales Orders list, and the panel inside an order, read straight from the dispatch side. You never set these by hand.

LABEL	MEANING
Not submitted	The order is still a draft. Nothing has gone to dispatch yet.
Awaiting acceptance	Confirmed. The request is sitting in Depot's queue, not yet accepted.
In fulfilment	Accepted. One or more shipments are being prepared, but none has shipped yet.
Partially fulfilled	Some, but not all, of the ordered quantity has shipped.
Fully fulfilled	The full ordered quantity has shipped.
Rejected	Depot rejected the request, so the order is cancelled with the reason shown.

A REJECTION CANCELS THE ORDER

If the dispatch team rejects a fulfilment request, the sales order is cancelled automatically and the rejection reason is shown on it. If the order is still valid, fix whatever caused the rejection and raise it again as a new order. There is no way to un-reject in place.

Tracking and delivery

Each shipment carries its courier, tracking number, a tracking link, the expected delivery date and the actual delivery date. They appear on the order's shipments panel, and the tracking link is clickable so you can check progress with the courier directly. The actual delivery date also matters for money: it starts the payment-due clock (see Collections).

YOU READ THIS, YOU DO NOT SET IT

Everything here comes from the dispatch team's work in Depot. Snorkel shows it so you can answer a partner's "where is my order" without leaving your screen, but the dispatch and tracking details are entered on the Depot side.

Collections

`/sales/collections` PROCUREMENT FINANCE ADMIN

Collections is the money-owed view: every invoiced order with an outstanding balance, overdue ones first. It is where you chase payments and record them as they come in, without opening each order one by one.

WHAT IT'S FOR	READ OR ACT?	WHO	TOTALS
Chasing and recording money owed.	Read; record receipts inline.	SALES FINANCE ADMIN	Outstanding & overdue, top right.

Reading it

Two big totals sit at the top: the full **outstanding** balance and the **overdue** portion. The table lists each order with its invoice, partner, total, received, balance, due date and how many days overdue. Tick **Overdue only** to focus on the late ones, and **CSV** downloads the current view.

> ⚠ COLLECTIONS IS NOT A PARTY BALANCE
>
> Collections lists only invoices that still have money owed. An invoice that is overpaid, or fully covered by a credit note, does not appear — so adding up this list by partner **overstates** what that partner owes (in September 2026 this alone made 18 partners (23 invoices) look out of step with Tally). To compare a partner's balance with Tally, use **Party Balances**.

Party Balances

Sales → Party Balances (or the **Party balances →** button on Collections) shows one row per partner: billed, credit notes, received and the **balance** — everything, including overpaid and fully-credited invoices. The balance is signed: a partner *in credit* with us shows in green as **Cr ₹…**. The three tiles give the total owed to us, the total held in credit, and the net. Filter **All / Owing / In credit**, search by partner, sort by balance, and **Export** downloads exactly the rows on screen — this is the file to reconcile against Tally.

The same invoices feed both screens, so a partner's *open* amount on Party Balances always equals its total on Collections; the difference is only the credits Collections leaves out.

Recording a receipt

1. **Click Record on the order's row.** A small form opens, pre-filled with the full balance.

2. **Set the amount, date, mode and reference** (a UTR or cheque number). Part-payments are fine, just enter what came in.
3. **Save.** The balance, payment state and the outstanding totals all update.

> ⓘ HOW THE DUE DATE IS WORKED OUT
>
> The payment-due date is the delivery date (or the dispatch date if delivery is not yet recorded) plus the credit days. The clock therefore only starts once dispatch has actually shipped or delivered the order. The credit days come from the channel when it is set to Auto collection, otherwise from the partner's own terms. Anything past its due date with a balance still owing shows as **overdue** in red.

Credit Notes

`/sales/credit-notes` PROCUREMENT FINANCE ADMIN

A credit note reduces an invoice you have already raised. You issue one when a partner was billed for more than they should pay: short supply, goods lost or damaged on us, unsold stock returned, or a price drop after supply. It lowers what the partner owes and reduces the GST you report, so the transaction balances on the government portal.

WHAT IT'S FOR	READ OR ACT?	WHO	NEEDS
Crediting back part of an invoiced order.	Act: raise, issue, print.	SALES FINANCE ADMIN	An order with an invoice already generated.

When to raise one

Pick the reason that fits; it prints on the document and helps at filing time.

- **Under-supply:** you billed more than you actually supplied.
- **Sales return:** unsold stock came back from a channel.
- **Price drop after supply:** a new discount or market correction. Keep the quantity the same and credit only the drop in rate.
- **Transit loss or damage:** goods lost or damaged on the way, our responsibility. Use a free-form line when it does not map to a specific product.

Raising a credit note

1. **Start from the invoiced order.** Open the sales order and click **Raise credit note** in its Credit Notes panel, or go to **Credit Notes → New credit note** and pick the order. Only orders that already have an invoice can be credited.
2. **Choose the reason and set the lines.** The order's invoice lines load in. Enter the **credit quantity** on each line you are crediting (it cannot exceed what remains on that line), and adjust the **rate** if needed. For a price drop, leave the quantity and lower the rate to the per-unit drop. Use **+ Free-form line** for anything without a product line, such as transit damage.
3. **Check the total.** The running total and the remaining creditable amount show at the bottom. A credit note can never credit more than the invoice value, and the form blocks you if it would.
4. **Save as draft.** A draft is fully editable and has no number yet. Nothing changes on the order until you issue it.

5 **Issue it.** Issuing assigns the permanent credit-note number (LOT/CN/<year>/NNNN), locks the lines, and reduces the order's net due straight away.

What it does to the order

Once issued, the credit lowers the **net due** on the order: net due is the invoice total, minus credits, minus what has already been received. In the ₹2,00,000 example, a ₹50,000 credit note means once ₹1,50,000 is collected the order is fully settled. The credited GST is shown on the document so you can include it in your next return.

Printing and sharing

Open an issued credit note and click **Print**. It opens the formatted CREDIT NOTE, which references the original invoice, and prints automatically. To send it as a file, choose **Save as PDF** in the print dialog. The document mirrors the tax invoice, with CGST and SGST for in-state partners or IGST for out-of-state.

ⓘ A CREDIT NOTE IS MONEY AND TAX ONLY, NOT STOCK

Issuing a credit note does not move any inventory. Returned or short goods are handled separately by the dispatch team. The credit note only adjusts what the partner owes and the GST you report.

CANCELLING

An issued credit note can be cancelled with a reason, which reverses its effect on the order's balance. If you have already reported it in a GST return, account for the reversal in your next return as well.

Partners

/sales/partners PROCUREMENT FINANCE ADMIN

Partners are the shops and distributors we sell to, our GT and MT customers. Their record holds the tax details and the credit terms that every sales order to them inherits, so it is the master behind offline sales.

WHAT IT'S FOR	READ OR ACT?	WHO	DRIVES
The customer master for offline sales.	View all; manage with permission.	SALES FINANCE ADMIN	Order credit terms & invoice tax.

The list

Each partner row shows its code, name, channel, state, GSTIN, contact, default credit days and whether it is active. Filter by channel, toggle **Active only**, search by name, GSTIN or state, and **Export CSV** the view. Click a partner to open its detail, where you can edit it (with permission) and see its orders.

A partner record

`Identity`	Name, channel (GT / MT), partner type.
`Tax & place`	GSTIN, state and city. The state is the "place of supply" that decides how an invoice to this partner is taxed.
`Credit days`	The default payment terms (commonly 45 days). Every order to this partner starts with this, overridable per order.
`Contact & addresses`	Contact person, phone, and the billing / shipping addresses that print on the invoice.

STATE AND GSTIN DECIDE THE INVOICE TAX

Just like vendors, a partner's state and GSTIN determine whether their invoices carry CGST + SGST (same state as us) or IGST (different state). Set them correctly when you create the partner, every invoice depends on it.

A new partner **must** have a GSTIN (15 characters, e.g. 29ABCDE1234F1Z5) — or, if the partner is genuinely not GST-registered, tick **Not GST-registered**. The tick leaves the GSTIN blank and records the fact in the partner's notes, so the partner is never flagged as missing a GSTIN. Never type a placeholder such as "URP" or "NA" into the GSTIN box — it would print on the invoice. To remove a GSTIN from an existing partner, tick the same box; unticking it later (or entering a real GSTIN) removes the "not registered" note again.

Channels

`/sales/settings` ADMIN

Channels are the offline sales routes, General Trade, Modern Trade, and any others, and this screen defines them and, crucially, which dispatch channel each one hands off to. It is an admin setup screen you rarely need to touch.

WHAT IT'S FOR	READ OR ACT?	WHO	SETS
Defining sales channels & their dispatch link.	Setup: add and map channels.	ADMIN	Where confirmed orders go to dispatch.

The mapping

Each channel has a short key (GT, MT), a label, a **dispatch channel** it maps to, a sort order and an active flag. The dispatch-channel link is the important part: when an order on this channel is confirmed, the fulfilment request it raises, and the shipments the dispatch team makes from it, are filed under the mapped dispatch channel.

Type, collection and sell-out

Three more settings per channel control how it behaves elsewhere:

SETTING	WHAT IT DOES
Type	General Trade, Modern Trade, Quick Commerce, Marketplace or Other. A label that groups the channel.
Collection	**Auto** sets the payment-due credit period from a fixed number of days you enter here, applied to every order on the channel. **Manual** leaves the credit days to the partner's own terms on each order.
Sell-out	When on, a confirmed order on this channel counts as a sell-out (a real consumer sale) in Odo, our sales-intelligence tool. Keep it on for General Trade and Modern Trade only.

Adding a channel

1. **Fill the Add channel row.** Give it a key, a label and the dispatch channel it should hand off to.
2. **Set its type, collection and sell-out.** Pick the type, choose Auto (with a period) or Manual collection, and turn Sell-out on only for GT or MT.

3 **Set a sort order and add it.** The sort order controls where it appears in dropdowns. You can change any of this from the table later.

⚠ MAP EVERY CHANNEL TO A DISPATCH CHANNEL

A sales channel with no dispatch channel mapped has nowhere to send its goods when an order is confirmed, the fulfilment request will be refused. Set the mapping before orders start flowing on a new channel.

ⓘ SELL-OUT VS SELL-IN

Quick-commerce and marketplace channels are sell-in (stock we push to a platform), not a final consumer sale, so they stay off the Sell-out feed and are counted by Odo from the platform's own data instead. Turning Sell-out on for those would double-count. GT and MT, where the order is the actual sale, are the ones that feed Odo from here.

PART 6

Assets

A living register of what Legend of Toys owns and rents.

Asset Register

/assets PROCUREMENT APPROVER ADMIN

The Asset Register is a living list of the physical things Legend of Toys owns and rents: laptops, machines, furniture, tools. It tracks where each one is, who has it, what it cost, and its warranty or AMC dates. It is a record of what we have, not an accounting depreciation ledger.

WHAT IT'S FOR	READ OR ACT?	WHO	TILES
Tracking what we own & rent.	View; create/edit with permission.	PROCUREMENT APPROVER ADMIN	Total, in use, in storage, attention, expiring.

Reading the register

KPI tiles count the total assets and how many are in use, in storage, needing attention (damaged or in repair), and expiring (warranty or AMC lapsed or within 60 days, click the tile to filter). The table shows each asset's code, name, category, status, type, location, custodian, cost, warranty/AMC badge and document count. Filter by status, type, category and location; search by code, name or serial; and **Export CSV** the view. Click an asset to open it.

Two things that are not the same

Snorkel deliberately keeps two ideas separate, do not confuse them:

AXIS	WHAT IT CAPTURES
Status	Where the asset is in its life: in use, in storage, damaged, in repair, or retired.
Acquisition type	Whether we *own* it (purchased) or are *renting* it. A separate tag entirely.

An asset can be both "in use" and "rented" at once. Renting is never a status.

An asset record

Open an asset to see and edit (with permission) its details: name, category, status, location, custodian (a LOT person or a free-text name for floor/contract staff), vendor, serial and model numbers, cost, warranty and AMC dates, and a loose link to the PO it was bought on. Below are a **history timeline** of every change and a **documents** area for invoices and warranty cards. You can also **print a label** with the asset's code as a QR sticker, and **retire** an asset that is no longer in service.

ⓘ CODES ARE PERMANENT AND HISTORY IS AUTOMATIC

Each asset gets a permanent code (like `AST-0042`) that never changes, the one on its printed sticker. You do not write the history: Snorkel logs every status change, custody transfer, location move and document automatically as you edit. The full record is kept even after an asset is retired.

⚠ RETIRE, DON'T DELETE

When an asset leaves service, **retire** it (with a reason). Retired assets drop out of the active list but stay in the register and its history. Assets are never hard-deleted, so the record of what we once owned is never lost.

⛔ DOCUMENTS ARE PRIVATE

Files attached to an asset (invoices, warranty cards) are stored privately and only opened through Snorkel via a short-lived secure link. They are never on a public web address, treat them as confidential.

Categories & Locations

`/assets/settings` PROCUREMENT ADMIN

Categories & Locations are the two pick-lists that keep the Asset Register tidy: the kinds of asset (IT, Furniture, Machinery…) and the places they live (Office, Warehouse, Floor 1…). Manage them here so everyone files assets the same way.

WHAT IT'S FOR	READ OR ACT?	WHO	FEEDS
The asset category & location lists.	Setup: add and rename entries.	PROCUREMENT ADMIN	The dropdowns on every asset.

Managing the lists

1. **Type a name and add it** to either the Categories or the Locations list.
2. **Rename an entry** from its row if it needs tidying.

Whatever you set here is exactly what shows in the category and location dropdowns when someone creates or edits an asset.

✓ KEEP THE LISTS SHORT AND CLEAR

A handful of well-named categories and locations beats a long, overlapping list. Agree the names with the team so assets are filed consistently and the register's filters stay useful.

PART 7

Library & Admin

The company addresses every PO prints, and the roles that control who can do what.

Addresses

`/library/addresses` PROCUREMENT ADMIN

Addresses are **our own** company addresses, registered office, warehouses, delivery points, not suppliers or customers. They print on purchase orders as the delivery address and feed our tax details onto invoices, so they are part of the plumbing behind both buying and selling.

WHAT IT'S FOR	READ OR ACT?	WHO	PRINTS ON
Legend of Toys' own addresses.	Manage with permission.	PROCUREMENT ADMIN	PO delivery address; invoice seller.

Managing addresses

Each entry has a label, a legal name, the address lines, city, state, pincode and country, plus our GSTIN, phone and email. Add a new one or edit an existing one from the list. One address is marked as the default delivery address, which is what a new PO picks automatically.

THE REGISTERED-OFFICE ADDRESS SETS OUR TAX IDENTITY

Our own GSTIN and state, taken from the registered-office address here, are what decide whether an invoice is taxed as CGST + SGST or IGST against a customer. This figure is read live, never hard-coded, so keep it accurate, it touches every GST invoice we raise.

Purchase Units

`/library/purchase-units` PROCUREMENT ADMIN

Some parts are **bought** in a bulk unit (a roll of shrink wrap, a packet, a box) but **issued and costed** by the piece. Purchase Units is where a buyer tells Snorkel what that bulk unit is and how many pieces it holds, so the part's per-piece cost can derive itself from the PO instead of being typed in by hand.

WHAT IT'S FOR	READ OR ACT?	WHO	FEEDS
Bulk-unit → per-piece cost conversions.	Manage with permission.	PROCUREMENT (Raise PO)	Every part's stored per-piece cost.

What's on the list

The list holds every **active** part that has ever been bought on an India PO in a unit other than **pcs**, so a per-piece cost cannot yet derive for it. For each part you see the part code, name and category, every unit and price it has actually been bought at (with the PO number), its stored weight in grams if it has one, and its current cost.

Setting the conversion

Type what the part is **bought as** (Roll, Packet, Box, whatever the vendor calls it) and **how many pieces that one unit holds**, then **Save**. The row shows a live preview of the per-piece cost as you type, worked out from the part's latest PO line. Once saved, that per-piece cost is what the rest of Snorkel reads as the part's unit cost, and it keeps re-deriving itself from PO history from then on: you are not typing a cost, you are telling the system how to work it out.

WORKED EXAMPLE

Shrink Wrap 14×18 is bought as a **Roll** of **2,200** pieces. A PO priced at ₹5,040 per roll becomes **₹2.29** per piece, and that is the figure everywhere else in Snorkel treats as this part's cost.

KG IS NOT SET HERE

A part bought by weight (screws, for example) already converts through its **stored weight per piece**, so it never needs an entry on this screen and the Bought as / Pieces per unit fields stay blank for it. If a kg-derived cost looks wrong, the fix is a re-weigh of the part, not a row here.

SET BOTH FIELDS, OR CLEAR BOTH

A unit with no pieces count (or a count with no unit) does nothing, Snorkel asks you to set both or clear both before it will save.

Re-derive all costs

Use **Re-derive all costs** to re-run the derivation for every part against its full PO history in one pass, useful after a bulk edit or if something looks stale. Snorkel reports how many costs were **applied**, **rejected** or left **unchanged**. It never blanks a cost that already exists, and it refuses to write a value that looks like a bulk price wearing a per-piece label (a shrink-wrap roll priced at ₹390 landing as ₹390 per piece, say), those show up as rejected rather than silently overwriting a correct cost.

IT ALSO RUNS ITSELF

Every time a PO is accepted, the same derivation runs automatically for the parts on that PO, so most costs stay current without a visit to this screen at all. Re-derive all costs is for catching up the rest, or checking nothing has drifted.

Roles & Permissions

`/admin/roles` ADMIN

Roles & Permissions is where the whole access model is defined. A role is a named bundle of switches, and this screen is the matrix where you turn those switches on and off. It is admin-only, because it controls who can buy, approve and pay.

WHAT IT'S FOR	READ OR ACT?	WHO	PAIRS WITH
Defining what each role can do.	Create, edit and delete roles.	ADMIN	Users (who gets which role).

The permission groups

The switches are grouped so they are easy to reason about:

GROUP	WHAT IT CONTROLS
Workspace	Seeing the procurement area at all (POs, vendors, forwarders).
Purchase Orders	Creating/amending POs, accepting them, final-approving them, routing payment, and handling China POs and new-product registration.
Masters	Managing vendors, forwarders and our company addresses.
Sales Orders	Viewing orders, managing and invoicing them, confirming to dispatch, recording collections, and managing partners and channels.
Admin	Managing roles and assigning them to people, this very screen.

Creating or editing a role

1. **Start a new role** (give it a key and a label) or open an existing one to edit.
2. **Toggle the switches** it should grant, group by group.
3. **Save.** Anyone holding that role picks up the change.

KEEP ACCEPTANCE, APPROVAL AND PAYMENT IN DIFFERENT ROLES

The whole point of the chain is separation: the person who raises and accepts a PO should not be the one who gives final approval, and payment is a third hand. When you build a role, resist bundling *accept*, *final-approve* and *route payment* together, that quietly removes the checks the system is designed to enforce.

NO ROLE STILL MEANS "CAN FILE REQUESTS"

A person with no Snorkel role assigned is not locked out, they can still sign in and file PO requests. Roles only add the ability to *act* on the buying, selling, asset and admin sides.

Users

`/admin/users` ADMIN

The Users screen is where you give each LOT person a Snorkel role. It is the pairing half of access control: Roles defines what a role can do; Users decides who has it. Admin-only.

WHAT IT'S FOR	READ OR ACT?	WHO	PAIRS WITH
Assigning a Snorkel role per person.	Act: set each person's role.	ADMIN	Roles & Permissions.

Assigning a role

1. **Find the person** in the list (search by name or email).
2. **Pick a role from their dropdown.** It saves immediately.
3. **To remove access, set them back to no role.** They keep the ability to file requests, but lose everything else.

ⓘ ACCOUNTS COME FROM ELSEWHERE

People accounts are created once in our store system, not here. This screen does not create or remove logins, it only attaches a Snorkel role to people who already exist. Each person has exactly one Snorkel role at a time.

✓ NO ROLE IS A VALID CHOICE

Leaving someone with no role is the right setting for most of the company, they can still raise requests, which is all most people ever need. Reserve the buying, approving and paying roles for the small teams who actually do those jobs.
