

Built Cars & Outsourced Builds

What's changing on the floor — a plain-language guide for the **Store team**, the in-house **Production team**, and the **Outsourced team**

Some of our cars arrive — or come back from an outside vendor — **already built**, not as loose parts. Until now these “built cars” sat in a **separate list** that didn’t match normal stock, causing confusion and counting mistakes.

From now on a built car is treated like any other part — it has a part name and sits in normal stock, like a motor or a wheel. Who does what does **not** change — this just makes built cars behave like everything else. Here’s the full flow and what changes for each team.

The two kinds of run — and who leads each

IN-HOUSE RUN	Led by the Production team. Production requests → Store issues parts → Production builds the cars → Dispatch
OUTSOURCED RUN	Led by the Outsourced team; the in-house team finishes. Outsourced requests → Store issues materials → Outsourced sends to vendor → cars come back → Store receives & stores → Production requests a finishing run → Store issues → Production finishes → Dispatch

Remember: the Production teams **decide and request** the runs. The Store only **acts on those requests** — it inwards material, stores it, and issues it when asked.

1

Store Team

You inward all material, store it, and issue it to production on request

YOUR ROLE

You receive everything that comes in, keep it in stock, and issue it when a production team asks. **You act on requests — you don't decide the runs.**

BEFORE

Built cars (bought, or back from a vendor) went into a **separate “built-units” list** that didn't match stock; vendor-returned cars had to be **scanned one-by-one** at “Ext Inwarding”.

NOW

Built cars go into **normal stock with a part name** (e.g. “Rift — Car”), like any other part. Vendor returns are simply **counted in** — no scanning each one.

YOUR STEPS

- 1. Inwarding a shipment:** open it in Receiving and pick what **physically arrived** — Parts/CKD (loose parts), SKD (part-built bundles), or FBU (fully built cars). If it doesn't match what was ordered, you'll see a short warning — note it, tell your supervisor, carry on (what arrived is what counts). Count and raise the GRN; built cars add into normal stock.
- 2. Receiving built cars back from the Outsourced team:** when they hand the cars over, open that outsourced run and press **“Receive built cars”** — type the count. They go straight into normal stock. No counting pool, no Ext Inwarding.
- 3. Issuing on a request:** when a production team asks for a run, issue what's requested — loose parts for a fresh build, or the **built car** for a finishing run. The screen shows whether to issue from loose parts or built cars, based on what's in stock.

■ **The difference: no separate built-units list and no one-by-one scanning — built cars are received, stored, and issued like any normal part.**

2

Production Team (in-house)

You decide and request the runs, build the cars, and send to dispatch

YOUR ROLE

You own production. You **decide the run**, request the material from the store, build, and dispatch — for both fresh builds and finishing the cars that come back from a vendor.

BEFORE

Building from built cars used a **special “built-unit” mode** that skipped the car and pulled it from the separate list.

NOW

A built car is simply **a part on your pick list** — no special mode.

YOUR STEPS

1. **Fresh / regular run:** request the run → the store issues the parts → build → QC → pack → dispatch, exactly as today.
2. **Finishing a vendor-built car:** once the store has received the built cars into stock, request a **finishing run** → the store issues the **built car** plus the finishing kit (battery, packaging, etc.) → you finish and pack → dispatch. Same stations as always — the built car just appears as a part to issue.

■ The difference: no special “built-unit mode” — whether you’re building from loose parts or finishing a vendor car, you request, the store issues, you build.

3

Outsourced Team

You coordinate the vendor build and hand the finished cars to the store

YOUR ROLE

You lead outsourced builds: get materials issued, send them to the vendor, monitor, and bring the built cars back to the store. **You hand over to the store — the in-house team finishes the product.**

BEFORE

An outsourced job was **one confusing run** with a two-step “build then finish” on the same run, a **separate counting pool**, and **one-by-one scanning** at Ext Inwarding. Runs got stuck and cars were miscounted.

NOW

Your part is clean and linear: **request** → **send** → **monitor** → **bring back** → **hand to store**. No finish step on your run — the in-house team finishes it as a normal run.

YOUR STEPS

1. Create the outsourced run and **request the build materials**; the store issues them to you.
2. **Send the materials to the vendor** and monitor the build.
3. When the built cars come back, **hand them to the store** — they count them straight into stock (“Receive built cars”). No pool, no scanning.
4. **You’re done there.** The in-house Production team then requests a **finishing run** to turn the built cars into finished, dispatchable units.

■ The difference: no two-step build/finish on your run, no counting pool, no Ext Inwarding. You bring cars back to the store; the in-house team finishes them.

*This change is live. **Production decides and requests; the Store inwards, stores and issues; built cars are now just normal stock.** Any questions — please ask your supervisor. · Legend of Toys*
