

Built Cars & Outsourced Builds

What's changing on the floor — a plain-language guide for the Store, Production & Outsourcing teams

Some of our cars arrive — or come back from an outside vendor — **already built**, not as loose parts. Until now these “built cars” were tracked in a **separate list** that didn't line up with normal stock, which caused confusion and counting mistakes.

From now on, a built car is treated like any other part — it has a part name and sits in normal stock, just like a motor or a wheel. Here's what changes for each team: how it worked before, and exactly what to do now.

1

Store / Garage Team

When built cars arrive (Receiving)

BEFORE

When built cars arrived, they went into a **separate “built units” list** — handled differently from normal parts, and not matching your stock counts.

NOW

Built cars come into **normal stock with a part name** (e.g. “Rift — Car”), exactly like any other part you receive.

YOUR STEPS

1. When a shipment arrives, open it in **Receiving** and choose what **physically arrived**: **Parts/CKD** (loose parts), **SKD** (part-built bundles), or **FBU** (fully built cars). Look at the boxes and pick what matches reality.
2. If what arrived doesn't match what was ordered, you'll see a short **warning** on screen. That's fine — note it, tell your supervisor, and carry on. **What you actually received is always what counts.**
3. Count and raise the **GRN** as usual. Built cars now show as part lines (e.g. “Rift — Car”, “Rift — Remote”) and add straight into normal stock.

■ The difference: no more separate built-units list — built cars are just parts now.

2

Production Team

Building in-house

BEFORE

To make a product from built cars, you used a **special “built-unit” mode** that skipped the car and pulled it from the separate list.

NOW

A built car is simply **a line on your pick list**, like any other part.

YOUR STEPS

1. When you run a product that uses built cars, the pick list shows the **built car** (e.g. “Rift — Car”) and remote as parts to issue — alongside the battery, packaging, and so on.
2. Issue them **like any other parts**. Stock comes down normally.
3. Build, finish, and scan through the **usual stations** — Inwarding → QC → Packaging — exactly as you do today.

■ The difference: no special “built-unit mode”. The store still decides, when issuing, whether to fulfil a run from loose parts or from built cars — based on what's in stock.

3

Outsourcing

Cars built by an outside vendor

BEFORE

An outsourced job was **one run with a confusing two-step “build then finish”**, plus a **separate counting pool**, and you had to **scan every returned car** at a special “Ext Inwarding” station. Runs got stuck and cars were miscounted.

NOW

Much simpler: **send materials out → receive the built cars into normal stock → finish them as a normal production run**.

YOUR STEPS

1. Create the outsourced run and **issue the build materials** (the car/remote parts the vendor needs to build).
2. Send them to the vendor — the run moves to “**At vendor**”.
3. When built cars come back, open the run and press “**Receive built cars**”. Just type the count — they go straight into normal stock. **No counting pool, no Ext Inwarding scanning**.
4. To turn them into finished, sellable units, raise a **normal production run** that uses those built cars — same as any in-house finish. Scan through the usual stations.

■ The difference: no two-step build/finish on one run, no counting pool, no Ext Inwarding station. **Send → receive into stock → finish as a normal run**.

This change is now live. Please follow the new steps from now on — and bring any questions to your supervisor. · Legend of Toys
