

Built Cars & Outsourced Builds

What's changing on the floor — a plain-language guide for the **Store team**, the in-house **Production team**, and the **Outsourced team**

Our cars are built in different ways — from loose parts (CKD), from part-built bundles (SKD), or as fully built cars (FBU), whether made in-house or returned by an outside vendor. To keep the floor simple, **the Production team now says up front how a run will be built**, and the Store simply issues exactly that.

A built car sits in **normal stock with its own name** (e.g. “Rift — Car”), like a motor or a wheel. Who does what doesn't change — Production decides and requests; the Store inwards, stores and issues. Here's the full flow and what changes for each team.

The two kinds of run — and who leads each

IN-HOUSE RUN

Led by the Production team.

Production picks the format (CKD / SKD / FBU) and requests the run → Store issues exactly that → Production builds → Dispatch

OUTSOURCED RUN

Led by the Outsourced team; the in-house team finishes.

Outsourced requests → Store issues build materials → Outsourced sends to vendor → built cars come back → Store receives them in Receiving & links the run → Production requests a finishing run (FBU) → Store issues → Production finishes → Dispatch

Remember: Production decides and requests the runs — including how each run is built. The Store acts on those requests: it issues exactly what the run asks for, or **rejects the run** if stock can't match — it never changes the run itself.

1

Store Team

You inward all material, store it, and issue exactly what each run asks for

YOUR ROLE

You receive everything that comes in, keep it in stock, and issue it when a production team asks. **You act on requests — you don't decide the runs or how they're built.**

BEFORE

Built cars sat in a separate "built-units" list that didn't match stock; you also **chose at issue time** whether to give loose parts or built cars, and vendor returns were scanned one-by-one at "Ext Inwarding".

NOW

Built cars are **normal stock with a part name** (e.g. "Rift — Car"). The run already says how it's built, so you just issue exactly that — no choosing. Vendor returns come in through normal Receiving.

YOUR STEPS

- 1. Inwarding a shipment:** open it in Receiving and pick what **physically arrived** — Parts/CKD (loose parts), SKD (part-built bundles), or FBU (fully built cars). If it doesn't match what was ordered you'll see a short warning — note it, tell your supervisor, carry on (what arrived is what counts). Count and raise the GRN; built cars add into normal stock.
- 2. Receiving vendor-built cars:** when the Outsourced team's cars come back, create the shipment in Receiving, declare **FBU**, and **link the outsourced run** from the list. Count and raise the GRN — the cars go into normal stock and the outsourced run **closes itself** when fully received. No counting pool, no Ext Inwarding, no separate button.
- 3. Issuing a run:** issue **exactly what the run asks for** — the run's format decides the pick list (loose parts for a CKD build, the built car for an FBU / finishing run). If you can't fulfil what the run asks for, **reject the run** and ask Production to raise it again to match what's in stock. You don't switch a run between parts and built cars — that's Production's call.

■ **The difference:** You no longer choose parts-vs-built or scan returns one-by-one. The run tells you what to issue; you issue it 1:1 or reject it. Built cars are received, stored and issued like any normal part.

2

Production Team (in-house)

You decide and request the runs — including how they're built — then build and dispatch

YOUR ROLE

You own production. You decide the run, choose how it's built, request the material from the store, build, and dispatch — for both fresh builds and finishing the cars that come back from a vendor.

BEFORE

Building from built cars used a special "built-unit" mode, and the **store** decided at issue time whether to give you parts or built cars.

NOW

When you create a run you **pick its format** — CKD (loose parts), SKD (part-built bundles), or FBU (fully built cars). The store then issues exactly that. If built cars are in stock, the screen shows it and **defaults the run to FBU** — "finish these first".

YOUR STEPS

1. **Fresh / regular run:** create the run, **pick the format** (CKD / SKD / FBU) — it's required — then build → QC → pack → dispatch. If built cars are in stock the form says so and pre-selects FBU; change it if you mean to build from loose parts.
2. **Finishing a vendor-built car:** once the store has received the built cars into stock, create a **Fresh run with format FBU** → the store issues the built car plus the finishing kit (battery, packaging, etc.) → you finish and pack → dispatch. A “finishing run” is just a Fresh FBU run — no special mode.

■ **The difference:** You set the format when you create the run, and built cars are “finish first”. There's no special built-unit mode, and the store no longer decides — it issues exactly what your run asked for.

3

Outsourced Team

You coordinate the vendor build and bring the finished cars back to the store

YOUR ROLE

You lead outsourced builds: get build materials issued, send them to the vendor, monitor, and bring the built cars back to the store. **You hand over to the store — the in-house team finishes the product.**

BEFORE

An outsourced job was one confusing run with a two-step “build then finish”, a separate counting pool, and one-by-one scanning at Ext Inwarding. Runs got stuck and cars were miscounted.

NOW

Your part is clean and linear: request → send → monitor → bring back. The cars come back through **normal Receiving** (the store links them to your run, which then closes itself). The in-house team finishes them as a normal FBU run.

YOUR STEPS

1. Create the outsourced run (pick the vendor) and **request the build materials** — the coloured car parts, not the finishing kit. The store issues them to you.
2. **Send the materials to the vendor** and monitor the build.
3. When the built cars come back, take them to the store. They receive them in Receiving, declare **FBU** and **link your run** — the cars go into stock and your run closes when fully received. No pool, no scanning, no separate button.
4. **You're done there.** The in-house Production team then creates a finishing run (Fresh, FBU) to turn the built cars into finished, dispatchable units.

■ **The difference:** No two-step build/finish on your run, no counting pool, no Ext Inwarding. The cars come back through normal Receiving linked to your run, which closes itself; the in-house team finishes them.

This change is live. Production decides and requests — including the run's format; the Store issues exactly that, or rejects the run if stock can't match; built cars are now just normal stock. Any questions — please ask your supervisor. · Legend of Toys
