PART 1

Getting Started

What Docket is, how to sign in, find your way around, and what your role lets you see.

Welcome to Docket

MEMBER REVIEWER ADMIN

Docket is the task manager for everyone at Legend of Toys. Whatever the work is, marketing, production, finance, a one-off errand, it becomes a **task** with a clear owner and a deadline, and you can follow it from the moment it is captured to the moment it is done. This manual is your self-serve guide to every screen in it.

What Docket is for

Docket answers three questions for the whole company at once: **what needs doing**, **who is accountable for it**, and **is it on track**. It is deliberately simple to use, type a title and press Enter and you have captured a task, and just as deliberately honest about the past: once a deadline is set it cannot be quietly edited away, and a task can never be silently deleted.

The shape of a task

Every task carries the same handful of things. You will see them again and again throughout the app.

ON A TASK	WHAT IT MEANS
Owner	The one person accountable for getting it done. A task has exactly one owner.
Collaborators	Other people helping. They can comment and add notes and sub-tasks, but the owner stays accountable.
Team	The department the task belongs to, drawn live from the company's people directory.
Status	One of five: Not started, In progress, Done, Blocked, or Abandoned.
Priority	P0 (immediate) through P3 (low). P2 is the normal default.
Deadline	When it is due. The first deadline you set is locked as the original promise; later changes are recorded as revisions.
ID	A permanent number like `DKT-1042` that never changes, so a task can always be found and quoted.

ⓘ TWO PRINCIPLES TO REMEMBER

Docket keeps an honest record. **The original deadline is locked** the first time it is set, every later change is logged with a reason, so “when did we promise this?” always has an answer. And **tasks are never deleted**; a task you decide not to do is *Abandoned* (with a reason), which keeps it on the record rather than erasing it.

How the work is organised

Docket gives you two ways to group tasks, and they work very differently:

- A **Program** is a soft label you stick on a task, like “Diwali Launch”, to group related work. It changes nothing about who can see the task.
- A **Space** is a private, walled-off area. Only its members can see the tasks inside it, even admins are shut out unless invited. Everything that is not in a private space lives in the open **General** space.

How to use this manual

Each chapter covers one screen or one idea and follows the same shape: what it is for, how to read it, and what to do. Jump to the screen you are on using the Contents page or your PDF reader's bookmarks. Chapters are tagged with the roles that use them:

Callout boxes

✓ TIP

A faster or smarter way to do something.

⚠ WATCH OUT

A common mistake or something easy to misread.

⛔ IMPORTANT

Something permanent or audited: get it right the first time.

Signing In & Getting Around

MEMBER REVIEWER ADMIN

Docket opens with one click using your work Google account. Once you are in, a slim icon rail on the left takes you between the main screens, a sidebar beside it holds your Programs and Spaces, and a top bar carries search and the **+ New** button. This chapter covers signing in and finding your way around, on a computer and on a phone.

Signing in

Open `docket.legendoftoys.com` and press **Sign in with Google** on the sign-in card, using your `@legendoftoys.com` account. Personal accounts are refused; if sign-in bounces you back, sign out of any personal Google account first or use a fresh browser profile. There is nothing to set up, your account already knows which team you are on and what you are allowed to see.

The icon rail (computer)

The narrow strip at the far left is the main menu. Each icon has its name under it, and the page you are on is highlighted in yellow. You only ever see the icons your role allows.

ICON	WHERE IT GOES
Tasks	The Tasks list for the open General space (and any space or program you pick in the sidebar).
My tasks	Everything on your plate across every space you can see.
Checklist	Your recurring work.
Scratchpad	Your private notes and calculator.
Dashboard	The org-wide review screen. Only appears if you have been given it.
Manual	This manual.
Admin	Roles & permissions, Users and Spaces. Sits at the bottom of the rail, admins only.

At the very bottom of the rail is your **avatar** (your initial in a coloured circle). Click it for your name and role, **Keyboard shortcuts** and **Sign out**.

The sidebar: Programs and Spaces

Next to the rail, on the Tasks screens, the sidebar holds the two ways to group work (see the Programs and Spaces chapters):

`Programs`	Every program you have tasks in, with a count. Click one to see its tasks from every space. The **+** beside the heading creates a new program.
`Spaces`	**General** (the open space, always there), then **My spaces** (private spaces you own) and **By others** (private spaces someone added you to). The **+** beside the heading creates a new space.

Each group has a small arrow to fold it open or shut, and Docket remembers your choice. **Customize sidebar** at the bottom lets you tick which of Programs, My spaces and By others to show. The sidebar can be hidden to give the list more room: use the panel button at the left of the top bar, or press `[`.

On an Admin screen the sidebar switches to the three admin pages instead (see the Administration part).

The top bar

PART	WHAT IT DOES
Breadcrumb	Where you are, for example the space or program name. A padlock marks a private space. A number beside it shows how many tasks are on the screen.
Search box	Reads *Search tasks…* with `⌘K` beside it (`Ctrl K` on Windows). Click it to open the command bar (below), which finds tasks in every space you can open.
+ New	The yellow button. The main part starts a new task. The small arrow beside it offers **New task**, **New space** and **New program**.
?	Opens the keyboard-shortcuts sheet.
App launcher	Jumps to the other Legend of Toys apps.

The command bar: search and jump

Press `⌘K` (`Ctrl K` on Windows and Linux), or click the search box, to open the command bar from any screen. Type a few letters and it fuzzy-matches across:

- **Tasks, in every space you can open**: by title or `DKT-` number. Type at least two characters, or a number in any form (`247`, `DKT-247` or `#247`). Words match in any order, so *sop qc* finds a task called “QC checks for SOP”. If nothing matches exactly, Docket tries a typo-tolerant match (*chekclist* finds Checklist); that fallback appears only when there are no exact hits. Each result shows its space

and, for a sub-task, its parent (↳ *DKT-…*) on a desktop screen. `Enter` opens the task in place; `Ctrl`/`⌘` + `Enter` opens it as a full page.

- **Spaces and programs**: jump straight to one.
- **Navigation**: any screen you can reach from the rail.
- **Commands**: New task / space / program, Go to My tasks, switch List or Board view and row density (on the Tasks list), toggle the sidebar, keyboard shortcuts. While a task you can edit is open, *Add dependency to DKT-…* also appears (see *Inside a Task*).

With nothing typed it shows your last five picks under **Recent**, kept separately for each person on a shared browser. Use `↑` `↓` to move, `Enter` to run, `Esc` to close. While it looks across spaces the bar shows *Searching all spaces…*.

> ⓘ YOU ONLY FIND WHAT YOU COULD OPEN
>
> Search follows the same rule as opening a task. In General you find tasks that are yours, in your department, or that you collaborate on (everyone with view-all finds every General task). A private space's tasks appear only if you own it or are a member of it, and that includes admins. It works from any screen, not just the Tasks list.

Where you land

When you open Docket it sends you to the right place for your role. Founders and reviewers, the people who can see everything, land on the **Dashboard**. Everyone else lands on the **Tasks** list, which is where day-to-day work happens.

Keyboard shortcuts

- `⌘K` / `Ctrl K` opens the command bar from anywhere, even while typing.
- `/` jumps into the search box on the Tasks list; on every other screen it opens the command bar.
- `c` starts a new task, and `[` (or `⌘\`) hides or shows the sidebar.
- `?` shows the full shortcut sheet.
- The Tasks list and an open task have their own keys, covered in those chapters.

On a phone

At phone width (767 pixels and narrower) the rail and sidebar give way to a **tab bar along the bottom**:

Tabs	**Tasks**, **My tasks**, **Checklist**, then **Dashboard** if you have it (otherwise **Scratchpad**), and **More**.
More	Scratchpad (when Dashboard has taken its tab), **Manual**, **Admin** for admins, **Keyboard shortcuts** and **Sign out**.

Programs and Spaces	Tap the **menu button** at the left of the top bar to slide the sidebar in. The top bar also has search and a **+** that starts a new task.

The **Manual** (this guide) opens inside the same frame. On a phone it shows a **Contents** button to pick a chapter and a **PDF** button to download the printable version.

✓ QUICK CAPTURE ON THE GO

The yellow **+** in the top bar is always one tap away on a phone. Type the title, add it, and tidy up later.

Roles & What You Can See

MEMBER REVIEWER ADMIN

Docket gives each person the access that matches their job. Unlike some systems, having no special role in Docket is not the same as having no access, every signed-in LOT person is a full Member. This chapter explains the three roles used throughout this manual and what each unlocks.

The three roles

MEMBER	**Everyone, by default.** Any signed-in LOT person is a Member without an admin doing anything. A Member creates tasks, and sees their **own** tasks, anything they are a **collaborator** on, and every task in their **own department**. They can fully edit the tasks they own or created (and add comments, documents and sub-tasks to any task they can see).
REVIEWER	**The watcher.** A Reviewer sees *every* task across the whole company, plus the review Dashboard, but read-only. They can look at anything but do not change other people's tasks. Useful for managers and leads who need the full picture.
ADMIN	**Full control.** An Admin can see and edit any task, decide who has which role, share the Dashboard, and use the admin screens. Admin includes everything a Reviewer can do.

ⓘ HOW ACCESS ACTUALLY WORKS

Your access comes from a **role** an admin assigns you on the Users page. Most people have *no* role, which is the Member baseline above. Two switches sit behind the scenes: one lets a person **see all org tasks and the Dashboard** (that is the Reviewer), the other adds full **management** on top (that is the Admin). The three tags in this manual are plain-language names for those switches. If you cannot do something you think you should, an admin needs to adjust your role.

Who sees what

AREA	MEMBER	REVIEWER	ADMIN
Create tasks; use the Scratchpad	•	•	•

AREA	MEMBER	REVIEWER	ADMIN
See own + collaborator + own-team tasks	•	•	•
Edit the tasks you own or created	•	•	•
See *every* task in the company (read-only)		•	•
The review Dashboard	if shared	•	•
Edit / abandon *any* task			•
Roles, Users, Spaces, dashboard sharing			•

✓ SEEING A TASK IS NOT THE SAME AS EDITING IT

A Reviewer can open every task but the controls are simply not there for them, they read. Collaborators are in between: they can comment, attach documents and add sub-tasks on a task, but the core fields (owner, deadline, status) stay in the hands of the owner, the creator, or an admin.

Two things that sit outside roles

Two parts of Docket are governed separately from the three roles above, and both get their own chapters:

- **The Dashboard** can be handed to anyone, even a plain Member, without making them a Reviewer. See *The Dashboard*.
- **Private Spaces** are gated by membership, not role. Being an Admin does *not* let you into someone's private space; you have to be added (or break in through the audited admin recovery). See *Spaces*.

PART 2

Working with Tasks

Capturing work, the task list, the task view, and how a task lives from first idea to done.

The Tasks List

`/tasks` MEMBER REVIEWER ADMIN

The Tasks list is where you live. It is one screen that captures new work, shows what is on your plate, and lets you edit almost everything in the row without opening anything. Tasks are laid out as a tidy list of rows, grouped under collapsible headers, with columns you can show, hide and resize. This chapter is the longest in the manual because it covers the screen you will use most.

WHAT IT'S FOR	READ OR ACT?	WHO	SHOWS
Capturing, finding, and updating tasks.	Both: read your list and edit in place.	MEMBER REVIEWER ADMIN	The tasks you're allowed to see, in one space or program.

The layout

From top to bottom the screen has:

`Views bar`	A **List / Board** switch, a greyed-out **+ View** (saved views are coming later), and on the right a **Copy link** button. In a private space it also has a space dashboard button, and, for the space's owner, a space settings button.
`Toolbar`	On the left, **Group** and **Subtasks**. On the right, **Filter**, **Me**, **Archive done**, **Select**, the search box, **Columns**, **Customize** and the yellow **+ Task** button. On a phone the labelled buttons shrink to icons.
`The list`	The column header row, then the groups of tasks, each with its own header and a **+ Add task** line at the foot.

Capturing a task in one line

Click **+ Task** (or press `c`, or use **+ New** in the top bar) and a *New task* line opens under the toolbar. Type a title, press `Enter`, and the task exists. That is the whole capture step, no form, no required fields. The new task lands in **The Grid** so you can finish it off later.

Quick-add: type it, don't click it

The capture line (the top **+ Task** line, each group's **+ Add task** line, and a Board column's add line) reads a few shortcuts out of the title and turns them into **Owner**, **Deadline** and **Priority** chips *before* you save, so you can check what Docket understood.

TYPE	YOU GET
`@riya`	Owner. A first name, or a prefix that matches only one person. If two people fit, it stays as plain text.
`!p0` to `!p3`	Priority P0 to P3.
`today`, `tomorrow` / `tmrw`	That day.
`by fri`, `fri 5pm`, or a weekday as the last word	The next such weekday. A weekday in the middle of a sentence ("Sat with Riya") stays text.
`12 nov`, `nov 12`, `12/11`	A date; slash dates are day/month. `12/11` counts only if it is a future date within 60 days, so "3/4 sleeve" stays text.
`5pm`, `5:30pm`, `17:00`	A time (Indian time). A date with no time means **6 pm**.

The words that became a chip leave the title. Docket **never sets a deadline in the past**: a time that has already passed today rolls to tomorrow, and a date that cannot be read as a future one stays in the title. Pick a value from a chip yourself and it wins over the typed words, which go back into the title. Click the **×** on a chip to drop it and keep the words as text.

You can also capture straight into a group: every group ends with a **+ Add task** line, and the task is created already carrying that group's value (grouped by Owner, a new task gets that owner; grouped by Program, that program; grouped by Status, a task added under *In progress* is created in that status straight away). The group header has an **Add task** button too, which jumps you to that line. With a row focused, `c` opens its own group's line.

> ✓ CAPTURE FIRST, TIDY LATER
>
> Do not stop to fill in the owner and deadline while an idea is fresh. Get the title down, hit Enter, and move on. The Grid will remind you what still needs finishing.

The Grid: tasks that need setting up

Just-captured tasks sit in a dashed yellow group at the top of the list called **The Grid**, with the hint *needs an owner and a deadline to hit the board*. A task is in the Grid whenever it is missing an **owner** or a **deadline** (or both). Each Grid card has two small chips, **Owner** and **Deadline**: click one to fill it in right there. The moment a task has both, it leaves the Grid on its own and joins the main list below. Click the Grid's header to fold it away.

Triage The Grid

When the Grid has tasks you can edit, its header shows a **Triage N** button. It walks you through them one at a time, so a backlog of half-finished tasks takes minutes instead of a lot of clicking. Each card shows the task and the fields still needed; set the **Owner** and **Deadline** (you can type something like *fri 5pm* into the deadline box) and a progress line at the top tracks how far you are.

KEY	WHAT IT DOES
`Enter`	**Save & next**.
`A`	**Abandon** the task. A reason is required and logged.
`S`	**Skip** it and leave it in the Grid.
`←`	Back to the previous card.
`Esc`	Close. The list refreshes when you close.

Only the fields you actually touched are saved, and a deadline in the past is refused. A task that has both an owner and a deadline after saving leaves the Grid; one that still lacks one stays. Tasks you cannot edit are skipped.

Reading a row

Each task is one row, 36 pixels tall by default. At the left is a round **tick circle** (click it to mark the task done, or not done), then the title. The columns to the right are:

COLUMN	WHAT IT SHOWS
Name	The title, with the permanent `DKT-` number beside it (turn the numbers off in Customize). A `REV` tag means the deadline has been changed at least once. A sub-task count like 2/5 shows done out of total.
Status	Not started / In progress / Done / Blocked / Abandoned. Always shown.
Team	The department it belongs to.
Program	Its program label, if any. Hidden by default; turn it on in Columns.
Space	Which space it lives in. Appears only on My tasks and Program views, which span several spaces.
Owner	The accountable person, as an initial circle (hover for the full name).
Collaborators	Helpers, as small overlapping initial circles. Hover to see names.
Priority	A flag for P0 (immediate) to P3 (low).
Deadline	When it is due. Turns **red** once the date has passed on an open task.
Activity	Small counts of attached documents and comments.

The dependency icon

A task that is part of a dependency shows a small icon beside its title, on list rows and on board cards:

- **Red "waiting" icon with a number**: the task is waiting on that many open tasks.
- **"Blocking" icon with a number**: that many open tasks are waiting for this one.
- **Grey tick**: the task had blockers and every one is now cleared (done or abandoned).

Hover for a one-line summary. Click to open a small popover listing the linked tasks: click one to open it, or use the **x** to remove a link if you can edit the task. *Open DKT-… to add links* at the bottom takes you into the task, where new links are added (see *Inside a Task*). Tasks with no links show no icon. Marking a waiting task done asks for confirmation first, from the tick circle, the board and bulk updates alike.

Shaping the columns

- **Show or hide:** the **Columns** button lists every optional column with a tick. Name and Status are always on. **Reset columns** puts everything back (Program hidden again).
- **Resize:** drag the thin edge on the right of a column header.
- **Reorder:** drag a column header onto another one.
- **Sort:** click a header (Name, Status, Owner, Priority, Deadline). Click again to reverse, and a third time to switch sorting off.

Docket remembers your column choices on this device.

Customize: row density and ID numbers

The **Customize** button (the sliders icon) sets how roomy the list is: **Compact** (32 pixel rows), **Default** (36) or **Roomy** (44). Under *Show* it also toggles the `DKT-` ids and the Team column. On the Board, Customize sets card size instead (below).

Editing without opening anything

This is the heart of the screen. If you are allowed to edit a task, most cells are **click-to-edit** right in the row:

1. **Click a property cell** (Status, Team, Program, Owner or Priority) and a small picker opens, with a search box for the long lists. Pick a value and it saves instantly. An empty cell shows a faint icon when you hover it.
2. **Click the Deadline cell** to open a calendar. The first time, you just pick a date. After that, changing it asks for a **reason** (see below).
3. **Click the Collaborators cell's small +** to add a helper from a short list.
4. **Click the row itself** (the title or empty space) to open the task. See *Inside a Task*.
5. **Use the row's buttons.** Hover a row to reveal **+** (add a sub-task) and **…** (Open, Copy link, Add sub-task, Mark done, Abandon).

> ⚠ **REVISING A DEADLINE ALWAYS NEEDS A REASON**
>
> The *first* deadline you put on a task is its locked original promise, set with no questions asked. Every change after that asks for a short reason and is recorded on the task's history. This is on purpose: it is how Docket can always answer "why did this slip?". See *The Task Lifecycle* for the full story.

> ⓘ **IF A ROW WON'T LET YOU EDIT**
>
> You can only change the core fields of tasks you **own** or **created** (admins can change any). On tasks you merely collaborate on or can only view, the cells simply will not turn into editors. Abandoned tasks are read-only too. That is expected, not a glitch.

Keyboard on the list

Click a row to focus it (or Tab to it), then:

- `↓` `↑` (or `j` `k`) move between rows, and `Enter` opens the task.
- `x` (or `Space`) toggles done.
- `→` / `←` (or `l` / `h`) expand or collapse its sub-tasks, and `s` adds a sub-task.
- `f` opens Filter and `g` opens the Group menu.

Sub-tasks

A task can hold a list of sub-tasks (one level deep, sub-tasks cannot themselves have sub-tasks). When a task has them, an arrow and a done/total count appear next to its title; click the arrow to open the children as indented rows underneath. To add one, hover the parent row and click **+** (or press `s`); type a title and press Enter. New sub-tasks **inherit the parent's team and owner**, which you can change afterwards.

The **Subtasks** button in the toolbar has **Expand all** and **Collapse all**, and a choice between showing sub-tasks **Nested under parent** (the default) or **As separate tasks**, where every sub-task gets a row of its own. It appears once at least one task has sub-tasks.

Groups

The **Group** button on the left of the toolbar regroups the list by **Owner**, **Team**, **Status** or **Program** (or *No grouping*). Each group has a header with its name and a count. Click the header to **collapse or expand** the group; its **…** menu also offers **Collapse all groups** and **Expand all groups**. Docket remembers which groups you folded. An x on the Group button clears the grouping.

Finding tasks: search and filter

`Search`	The box on the right of the toolbar (press `/` to jump in) filters as you type, instantly. It matches the ID, title, owner, team, creator and collaborator names, and every word you type must match somewhere. For a search across spaces and screens use the command bar (`⌘K`).
`Filter`	Opens a small panel to filter by **Status**, **Team**, **Owner**, **Priority** and **Program**, with quick **Overdue** and **Revised** toggles, and a **Dependencies** pair: **Waiting on others** (tasks still waiting on an open blocker) and **Blocking others** (tasks others are still waiting on). Only one of the two can be on at a time, and a blocker that is already done or abandoned does not count. A number on the button says how many filters are on; *Clear filters* resets them.
`Me`	A one-click toggle that limits the list to tasks you own, are assigned, collaborate on or raised.
`Archive done`	Moves finished tasks out of the main list into a collapsed **Archived** section at the bottom, so the list shows only live work. Untick a task there to bring it back.

List view and Board view

The **List / Board** switch in the views bar flips between the two, and Docket remembers your choice. (My tasks is list-only.)

`List view`	The default: tasks as rows, with The Grid, inline editing, sub-tasks and bulk select, all as described above.
`Board view`	A Kanban: tasks become cards in columns. By default the columns are the statuses (Not started, In progress, Blocked, Done). Use **Group** to switch the columns to **Owner**, **Team** or **Program** instead.

To move a task, **drag its card into another column**. On a status board, dragging a card to **Done** marks it done; on an Owner board it reassigns the owner, and so on. Only cards you are allowed to edit move. From the keyboard, focus a card and press `Shift` + `←` / `→` to move it one column; plain arrows walk between cards, and `Enter` opens the task.

- **Collapse a column:** use the column's **…** menu, then *Collapse column*. It folds to a thin strip with the card count; click the strip to bring it back.
- **Add a card:** each column has its own add line, and the new task is created with that column's value.
- **Card size: Customize** offers Small, Medium and Large cards, and a toggle for the `DKT-` ids.

ⓘ WHAT THE BOARD SHOWS

Each card shows the title, `DKT-` number, owner, priority, deadline and any team, program or space tags, plus small sub-task, comment and document counts. Only top-level tasks appear as cards (a parent shows its sub-task count rather than separate cards), and **Abandoned** tasks are left off the board. Columns, Archive done, Select and row density are list-only tools. Board view also works inside a **Program** view.

Updating many tasks at once

When you need to make the same change to several tasks (assign them all to one person, push them all to next week, bump them all to P1), use **bulk update** instead of editing each row by hand. It works in The Grid and in the main list.

1. **Click Select** in the toolbar (or tick any row's box). A tick box appears on the left of every task you are allowed to edit. Tasks you only collaborate on or can view show a faint, locked box: you cannot pick those.
2. **Tick the tasks you want.** Pick them one by one, or use **Select all** to grab every editable task currently shown (your search and filters decide what "all" means).
3. **Use the bar that pops up at the bottom.** It shows how many are selected and has one button each for **Owner**, **Status**, **Priority**, **Deadline**, **Program**, **Collaborators** (add or remove), **Move** (to another space) and **Abandon**.
4. **Pick a value** and it applies to every selected task at once. The **x** at the left of the bar clears the selection; clicking **Select** again leaves bulk mode.

ⓘ ONLY YOUR TASKS CHANGE

A bulk action only touches tasks you are allowed to edit, which is why collaborator-only tasks cannot be ticked in the first place. If a few in your selection still cannot be changed, Docket updates the rest and tells you how many it skipped.

⚠ BULK DEADLINES STILL KEEP THE AUDIT TRAIL

Setting a deadline in bulk follows the same rule as a single task: tasks getting their *first* deadline are set silently, but if any selected task already has one, Docket asks for a single reason and records the change on each task's history. Abandoning in bulk likewise needs one reason.

Which space am I in?

The list shows **one space at a time**. By default that is **General**, the open company-wide space. If you click a private space in the sidebar, the breadcrumb shows its name (with a padlock) and the list shows only that space's tasks; anything you capture lands in that space. Click a program in the sidebar instead and you see that program's tasks from every space. Spaces and programs have their own chapters.

My tasks: everything on your plate, across every space

My tasks on the rail is different from the rest of the list. Instead of one space, it pulls together every task you are involved in **across all the spaces you can see**, in four groups (empty groups are hidden):

`Today & overdue`	Open tasks you own whose deadline is **today or earlier**, with the most overdue first. "Today" runs to the end of the day in Indian time, and the group re-sorts itself if you leave the tab open past midnight.
`Assigned to me`	The rest of the tasks you **own**. Its **+ Add task** line creates a task already assigned to you.
`Collaborating`	Tasks where you are a **collaborator** but not the owner.
`Raised by me`	Open tasks you created that someone else owns, so you can keep an eye on what you handed off.

Because it spans spaces, each row carries a **Space** column so you can see where a task lives. Every task is its own row here (no nesting of sub-tasks). Search, filters and bulk select work as on a normal list.

Clean up: the stale-work sweep

The **Clean up N** button at the top of My tasks opens `/tasks?lens=stale`, a list of your open work (sub-tasks included, recurring tasks not) that is **overdue by 30 days or more** or **untouched for 60 days or more**. Each row says why: *145d over* or *untouched 154d*. A task that is both appears once, under Overdue.

`Done`	Marks the task done.
`Revise`	Pick a new deadline and give a reason (logged). A past date is refused. If the task never had a deadline the button reads **Set date** and no reason is asked.
`Abandon`	Stops the task; a reason is required.

Tick several rows for a bulk **Done all** or **Abandon all** (one reason for all). On a phone the row actions sit in a **…** menu. People with view-all (Reviewers and admins) get a **Mine | Everyone** switch; Everyone groups the list by owner with an owner filter, but covers only spaces you can access (private spaces need membership). The sweep is pull-only: nothing is sent to anyone.

> ⚒ A TYPICAL PASS THROUGH YOUR LIST
>
> Open **My tasks** and clear **Today & overdue** first. Then glance at **The Grid** on the Tasks list and set an owner and deadline on anything sitting there. Sort by **Deadline** to bring the soonest to the top, and clear anything shown in red. Click a task to open it when you need comments or sub-tasks. Once in a while, use **Clean up** to retire or re-date work that has gone stale.

Inside a Task

`/tasks/detail` MEMBER REVIEWER ADMIN

Click a task anywhere in Docket and it opens in the **task view**: everything about that one task in a single place. By default it opens as a **modal**, a window over your list, and you can switch it to a **side panel** or a **full page** whenever you prefer. All three show the same task.

WHAT IT'S FOR	HOW TO OPEN	WHO	THREE LAYOUTS
Working on one task in depth.	Click a task row, card or Grid item.	MEMBER REVIEWER ADMIN	Modal (default), side panel, full page.

Modal, side panel, full page

`Modal`	The default. A centred window over a dimmed list. Click the dimmed area or press `Esc` to close it.
`Side panel`	A panel on the right while the list stays visible, scrollable and clickable behind it. Good for working down a list.
`Full page`	The task takes the whole screen inside Docket's normal frame. The top-right button then reads *Back to the list* and returns you to the list with the task still open.

Switch with the **Switch layout** button in the task's top bar (*Open tasks as* Modal, Side panel or Full page). Docket remembers your choice on this device. On a phone the task always fills the screen, with **Details** and **Activity** tabs at the top.

The top bar of the task

PART	WHAT IT DOES
‹ › arrows	Step to the previous or next task in the list you opened it from, without closing (`Ctrl` `Shift` `←` / `→`). They grey out at either end.
Breadcrumb	The space, the program (if any) and the `DKT-` number. Click the number to copy it.
Copy link	Copies a link that opens straight to this task as a full page.

PART	WHAT IT DOES
More actions (…)	Copy link, Copy task id, Add sub-task, Mark done, and **Abandon…**. On an abandoned task it offers **Reactivate**.
Switch layout	Modal / Side panel / Full page.
Close (x)	Closes the task. Also `Esc`.

What's on the task

The left side holds the task itself; the right side (or the Activity tab on a phone) holds the conversation.

SECTION	WHAT IT HOLDS
Title and description	The title (and, on a sub-task, a link up to its parent) and a free-text description. If you can edit the task, click either to change it.
Properties panel	A tidy list of fields: Status, Owner, Collaborators, Deadline, Priority, Team, Program, Space, Created (and Completed once done). Click a value to change it. A recurring checklist item shows **Repeats** in place of Deadline.
Dependencies	Waiting on, Blocking and Related links to other tasks. Shown once something is linked (see below).
Sub-tasks	The child tasks, with their own owners and statuses, and a done/total count.
Documents	Links to outside files (Drive, Sheets, anything with a web address). Docket stores the link, not the file.
Activity	Two tabs: **Comments**, with a box at the bottom to write a comment, and **History**, the full audit trail.

Sub-tasks and Documents are sections you can fold shut by clicking their headings.

Dependencies: waiting on, blocking, related

A dependency links two tasks so everyone can see what has to happen first. One link is shown from both ends: if DKT-12 is *waiting on* DKT-9, then DKT-9 shows as *blocking* DKT-12.

LINK	WHAT IT MEANS
Waiting on	This task cannot really finish until the other task is done. While at least one of those other tasks is still open, this task counts as *waiting*.
Blocking	The other end of the same link: other tasks are waiting for this one.

LINK	WHAT IT MEANS
Related	A plain cross-reference with no order and no rules. Useful for “see also”.

Links can join tasks in different spaces. Once you have linked at least one task, a **Dependencies** strip appears above the description, with a group for each kind (empty groups are hidden). Each row shows a status dot, the `DKT-` number, the title, the owner and the due date; click a row to open that task.

Adding a dependency

1. Open the task and choose **Add dependency…** in the **More actions** (…) menu. Three other doors lead to the same place: the **+ Add** button on the Dependencies strip, the **+ Dependency** button beside the Description heading when nothing is linked yet, and `⌘K` then *Add dependency to DKT-…* while the task is open.
2. Pick the kind: **Waiting on…**, **Blocks…** or **Related to…**.
3. Search for the other task by title or `DKT-` number (two or more characters, in every space you can open) and press `Enter` or click it. Docket confirms with *Linked DKT-…*.

To remove a link, click the **x** at the end of its row (*Remove link*). You need edit rights on the task you are working in. Both adding and removing are written to the History tab of both tasks (*Added dependency*, *Removed dependency*). When the last open blocker of a task is finished or abandoned, the waiting task gets an *Unblocked* line in its History.

Finished and abandoned blockers

A blocker counts as **cleared** once it is Done. An **abandoned** blocker also counts as cleared, but its row is tagged **Blocker abandoned** so the waiting owner knows the work was dropped, not completed. Cleared links stay on the strip as a record.

Marking a waiting task done

Docket warns you but does not stop you. If you mark a task done while it is still waiting on open tasks, a confirmation appears, for example *DKT-9 is still waiting on: DKT-4 Print run. Mark done anyway?* Confirm to finish it, or cancel to leave it as it is. The same warning appears when you tick it in the list, drag it on the board or use it in a bulk update (*3 of these are waiting on open tasks. Mark all done anyway?*).

Date clash hint

If a task is waiting on a blocker that is due *after* the task itself, the blocker’s row shows an amber line such as *DKT-123 is due 30 Nov, after this task (25 Nov)*. It is only a hint. Docket never moves a date for you, because every deadline change needs a reason.

Tasks you can’t see

If a linked task lives in a space you cannot open, it appears only as *1 task you can’t see* (or *3 tasks you can’t see*). No title, number or owner is shown, but it still counts towards *waiting*.

What Docket refuses

YOU TRY TO…	DOCKET SAYS
Make a loop (A waits on B, B waits on C, C waits on A)	*That would make a loop of tasks waiting on each other.*
Link a task to itself	*A task can't depend on itself.*
Link the same two tasks again	*These two tasks are already linked.*
Add a dependency to a recurring (checklist) task	*Recurring tasks can't have dependencies.*
Change links on an abandoned task, or link to one	*This task is abandoned, so it's read-only.* / *That task is abandoned. Pick an open one.* Reactivate the task first to change its links.
Link to a task you cannot open	*You can't open that task, so you can't link it.*

ⓘ WAITING AND BLOCKED ARE TWO DIFFERENT THINGS

The **Blocked** status is still a manual choice you make in the Status picker; Docket never sets it for you, and a waiting task keeps whatever status it has. Nothing about a dependency changes a deadline or a status automatically. Reviewers can see links but not change them.

Editing

Every property is click-to-edit in the panel: click it, pick the new value, and it saves. The title and description save when you click away. You can only edit a task you own, created, or (as an admin) any task. Reviewers see all of this without the edit controls.

With focus outside a text box, these keys work inside an open task: `Shift`+`S` status, `Shift`+`A` owner, `Shift`+`D` deadline, `Shift`+`P` priority, `s` add a sub-task.

The deadline, and why it is locked

Under Deadline the panel shows the current date, and, once it has been moved, a `REV` tag with the number of revisions plus a line reading *Original … · locked*. The first date you set is the original promise and never changes. To move the deadline, open it and enter the new date and a **required reason**; the button reads **Set** the first time and **Revise** after that.

ABANDONING IS THE ONLY WAY TO STOP A TASK

There is no delete button anywhere in Docket. If a task should not be done, choose **Abandon…** (in the Status picker or the More actions menu) and give a reason; it is required and recorded. The task stays visible with a banner reading *Abandoned* and your reason. An abandoned task is **read-only** until it is **reactivated**: it cannot be edited, re-dated, re-parented, moved, commented on, or have collaborators or documents changed, and the server refuses any such change. The comment box is replaced by *This task is abandoned — reactivate it to comment.* You also cannot add a sub-task under it. Reactivating (a status change) is the one thing that works, and an admin can still delete a comment on it. The owner, creator or an admin can use the banner's **Reactivate** button, which is also logged.

Comments and History

The **Comments** tab is a running discussion on the task. Type in the box at the bottom and press **Comment**; you can edit or delete your own comments. The **History** tab is the unchangeable record: every status change, every deadline revision (with its reason), every owner or priority change, every collaborator or document added or removed. You cannot edit history; that is the point of it.

SHARE A TASK WITH A LINK

Use **Copy link** to send someone a direct link to the task; it opens on the full page. An address of the form `/tasks?task=…` opens the task over the Tasks list instead, which is also how Docket returns you to the list after you leave the full page. Either way the person only sees the task if they are allowed to see it.

MOVING A TASK TO ANOTHER SPACE

The **Space** property lets the owner move a task into a different space, including a private one you belong to. Moving a task changes who can see it. Sub-tasks always follow their parent's space.

The Task Lifecycle

MEMBER REVIEWER ADMIN

A task in Docket follows the same arc whatever the work is. Understanding that arc, and the few rules Docket enforces along the way, is the key to using it well. This chapter is the "why" behind the buttons.

The five statuses

Every task is in exactly one of five states. The first four you set yourself; the fifth has its own door.

STATUS	MEANS
Not started	Captured, but work hasn't begun.
In progress	Someone is actively working on it.
Done	Finished. Docket stamps the completion time.
Blocked	Stuck on something outside the owner's control, waiting on someone or something else.
Abandoned	Deliberately stopped, with a reason. The only terminal end besides Done.

The arc of a task

1. **Captured.** A title is typed and the task exists, sitting in **The Grid** as *Not started*.
2. **Set up.** An owner and a deadline are added; it leaves the Grid and joins the main list.
3. **Worked.** The owner moves it to *In progress*, adds collaborators, comments, documents and sub-tasks as needed.
4. **Finished or stopped.** It becomes *Done*, or, if it should not be done at all, it is *Abandoned* with a reason. If it gets stuck, it sits at *Blocked* until it can move again.

The three things Docket will not let you fudge

Docket is intentionally strict about a few things, so the record stays trustworthy.

1. THE ORIGINAL DEADLINE IS LOCKED

The **first** deadline put on a task becomes its locked original promise, and it never changes. To move the deadline afterwards you must **revise** it, which always asks for a short reason and records the change (old date → new date, with your reason) on the task's History. You can revise as many times as you need, but every slip is on the record. This is how Docket can always show whether work landed when it was first promised.

2. TASKS ARE NEVER DELETED

There is no delete. A task you decide against is **Abandoned**, with a required reason, and stays visible marked as such. Nothing vanishes from the company's record, and an abandoned task can be reactivated if things change.

3. THE CREATED DATE AND CREATOR ARE PERMANENT

When a task was created, and by whom, can never be edited. So can the task's `DKT-` ID. These are anchors you can always trust.

Owner, creator, collaborators

Three kinds of people relate to a task, and they are not the same:

`Owner`	The single accountable person. There is exactly one. The owner can change every field and move the status.
`Creator`	Whoever first captured it, set automatically and never changed. The creator can also edit the task.
`Collaborators`	Helpers. They can comment, attach documents and add sub-tasks, but they do not change the owner, deadline or status. Many people can collaborate.

✓ ONE OWNER, ON PURPOSE

Docket gives every task exactly one owner so accountability is never split. If two people are doing the work, one owns it and the other is a collaborator. “Whose is this?” always has a one-name answer.

Sub-tasks

A task can be broken into sub-tasks, but only **one level deep**: a sub-task cannot have its own sub-tasks. New sub-tasks start by inheriting their parent's team and owner, which you can then change.

Each is a full task in its own right with its own status and deadline; the parent shows a done/total count so you can see progress at a glance.

PART 3

Organising Work

The two ways to group tasks: Programs (a soft label) and Spaces (a private, walled-off area).

Programs

MEMBER REVIEWER ADMIN

A Program is a simple label you put on tasks to group related work, “Diwali Launch”, “Warehouse Move”, “Q3 Hiring”. It is the lightweight way to tie scattered tasks together without changing who can see anything.

WHAT IT IS	AFFECTS ACCESS?	WHO CAN MAKE ONE	PER TASK
A soft, company-wide grouping label.	No. Purely a label.	Anyone, just by typing it.	Zero or one program.

Programs vs Spaces, the one thing to keep straight

Docket has two ways to organise, and people mix them up. The difference is access:

	PROGRAM	SPACE
What it is	A label on a task	An area a task lives in
Changes who can see the task?	**No**	**Yes**
How many per task	Zero or one	Always exactly one
Who creates it	Anyone, inline	Anyone (you become owner)

A Program just gathers tasks under a name. A Space walls tasks off. This chapter is Programs; the next is Spaces.

Creating a program

Use **+ New** in the top bar and choose **New program**, or the **+** beside *Programs* in the sidebar. Type a name and create it. If a program with that name already exists (capitals do not matter), you are simply taken to it instead of making a duplicate. You can also create one on the spot from a task, as below.

Adding a program to a task

1. **Click the Program cell** on a task row (turn the column on in **Columns** if you don’t see it), or the Program property in the task view.
2. **Pick an existing program** from the list. In the task view you can also **type a new name and press Enter** to create it on the spot.

3 **To remove it,** choose — *No program* — from the same dropdown.

Programs are shared across the whole company: a name you create is immediately available to everyone, and the list is case-insensitive, so “Diwali Launch” and “diwali launch” are treated as the same program rather than two.

Working by program

On the Tasks list, Program is a full citizen alongside Team:

- **Open a program** from the sidebar to see all its tasks across every space you can access. Programs in the sidebar show a task count, and only programs you have visible tasks in are listed. List and Board views both work there.
- **Filter** any list to a single program from the **Filter** panel.
- **Group** by program to see the list reflow into one collapsible group per program.

> ⓘ PROGRAM NAMES ARE VISIBLE; THE TASKS UNDERNEATH STILL AREN’T
>
> Because a program is just a shared label, its name is visible company-wide. But putting a program on a task in a private space does **not** reveal that task to anyone, the space's wall still holds. The label leaks the name, never the contents.

Spaces

`/tasks?space=` MEMBER REVIEWER ADMIN

A Space is a private, walled-off area for tasks. Only its members can see what is inside, even admins are shut out unless they are added. Everything that is not in a private space lives in the open **General** space, which is where the company's day-to-day work sits.

WHAT IT IS	AFFECTS ACCESS?	WHO CAN MAKE ONE	PER TASK
A hard visibility boundary around tasks.	Yes, this is its whole point.	Anyone; you become its owner.	Always exactly one space.

General: the open default

General is the single open space everyone shares. Every task that was around before spaces existed lives here, and so does anything you capture without choosing a space. Inside General, the normal visibility rules apply: you see your own, your collaborators' and your own department's tasks; reviewers and admins see everything. General cannot be renamed, archived, or deleted, it is always there.

Private spaces: the wall

A private space is the opposite of General: nobody can see it or anything in it unless they are a **member**. This is the strongest rule in Docket.

> **A PRIVATE SPACE BEATS EVEN ADMIN**
>
> Being an Admin or a Reviewer does **not** get you into a private space. If you are not a member, the space and its tasks are invisible to you, they do not appear in lists, search, the dashboard, or anywhere else. The only sanctioned way an admin can enter is the audited *break-glass recovery* (covered in the admin chapter), and that act is logged. Spaces are for genuinely confidential work.

Inside a private space, visibility is **flat**: every member sees every task in it, there is no department sub-filtering like in General. If you are in the space, you see all of it.

Creating and using a space

1. **Create it** with **+ New** then **New space** in the top bar, or the **+** beside *Spaces* in the sidebar. Give it a name and create it. You become its owner and first member.

2. **It appears in your sidebar** under **My spaces** (spaces you own); a space someone else added you to appears under **By others**. Click it to see only that space's tasks; anything you capture while inside it lands there.
3. **Add members** from the space's settings (the settings button at the right of the views bar, shown to the space's owner). Only people with a Docket login can be added.
4. **Move existing tasks in** using the Space property in the task view, or **Move** in the bulk bar.

Owning a space

The space's owner (and only the owner) can, from the space settings:

`Rename`	Change the space's name.
`Members`	Add or remove people. Only employees with a login can be members.
`Transfer ownership`	Hand the space to another member, for example before leaving the team.
`Archive`	Retire the space. It leaves the sidebar, but its tasks are kept.

Within a private space, a task can be edited by its owner, its creator, *or the space owner*, so the person running the space can keep its tasks tidy.

> ⓘ EACH SPACE HAS ITS OWN DASHBOARD
>
> From the views bar of a private space, the dashboard icon opens a dashboard scoped to just that space, the same tiles and breakdowns as the org dashboard, but only counting that space's tasks. Any member can view it.

> ⚠ IF A SPACE'S OWNER LEAVES
>
> If a space is orphaned (its owner is gone and nobody else can manage it), an admin can step in through the break-glass recovery on the admin Spaces screen, which makes them the owner and is recorded. The everyday answer, though, is to **transfer ownership** before the owner leaves.

PART 4

Checklists

Your recurring work: routines you tick off on a repeat schedule, kept separate from the task board.

Checklists

`/checklist` MEMBER REVIEWER ADMIN

Checklists are your **recurring** work: the things you do every day, every Monday, or on the first of the month, that don't deserve a fresh task each time. You set them up once with a repeat schedule, and they show up on your own checklist whenever they're due, ready to tick off.

WHAT IT'S FOR	WHOSE IT IS	WHO	FIND IT
Routine, repeating work you tick off.	One person's checklist at a time.	MEMBER REVIEWER ADMIN	**Checklist** on the icon rail.

Checklists vs Tasks

A normal task happens *once* and has a deadline. A checklist item happens *again and again* on a schedule and has no deadline, just a repeat rule. Because of that, checklist items are kept completely separate from the Tasks board:

> ⓘ RECURRING WORK STAYS OFF THE BOARD
>
> Checklist items **never appear on the Tasks list or the Dashboard**, and they don't count toward anyone's task totals. They live only on the `/checklist` page. If you open one in the task view it shows **Repeats** (its schedule) where a task would show a deadline.

The layout

The Checklist screen has three tabs along the top: **My day**, **Manage** and **Oversight**. Under each, work is grouped under collapsible headers, the same style as the Tasks list.

My day	What is due on the day you are viewing. The **Today** group lists every item due, ready to tick, with a done count (for example 3/5). Below it come any checklist templates assigned to you, and a **Recurring this week** group previewing the rest of this week's items with the days they fall on (read-only: you tick an item on its own day). Arrows beside the date step back to earlier days; the **Today** button brings you back. A **Today | Register** switch at the top flips the same checklist into a chart (see *The Register* below).

`Manage`	Where you set things up. **My recurring tasks** lists every recurring item you own with its schedule, and a **New** button to add one. **Checklist templates** below it holds reusable multi-section checklists for a role, with a **New template** button.
`Oversight`	For managers: per-person checklist adherence for a chosen date, covering people you manage or have assigned a checklist to. Click a person to see their run for that day, read-only.

Managers and reviewers who can view other people's checklists also get a person picker on My day, to *see* how a report is tracking (read-only, see below).

Creating a checklist item

1. **Open Manage and click New.** Give the item a title (e.g. "Check the cold-storage temperature log"), and optionally set who it is assigned to, its priority, team and a description.
2. **Choose how often it repeats** with the schedule picker: **Daily**, **Weekly** (tick the weekdays, e.g. Mon, Wed, Fri) or **Monthly** (a day of the month; in shorter months it falls on the last day).
3. **Set a time of day.** The time it should be done by, used only to order your day, it doesn't nag you.
4. **Click Add.** From now on it appears under **Today** whenever the schedule says it's due.

> ✓ OPTIONAL END DATE
>
> The schedule picker has an optional **Ends** date. Set one for a routine that should only run for a while (a temporary daily check during a launch, say), and the item **auto-drops off your checklist** once that date passes, no need to remember to retire it.

To change a schedule later, click the pencil beside the item in Manage. It opens the same schedule picker as a small popover; choose the new pattern and click **Save**.

Ticking things off

On the My day tab, tick the item to mark it done for that day; the progress count goes up and the tick **sticks across reloads** (it records a completion for that date). Made a mistake? Un-tick it and the completion is removed. Each day is its own slate, ticking today has no effect on yesterday or tomorrow.

The Register

At the top of My day is a **Today | Register** switch; Docket remembers your choice on this device. **Today** is the list described above. **Register** is a paper-style chart: your items run down the left, the dates they were due run across the top, and each item gets one cell per day. It shows the same ticks as Today, so ticking in either view is the same tick.

Window	**7D**, **14D** or **30D** (it opens on 14D). Use the ‹ › arrows to page back and forward, and **Today** to jump back. You can never page past today. Only dates on which at least one item was due become columns, so a Monday-only weekly item shows just Mondays.
Cells	**Green tick**: done. **Amber tick**: done late (after the section's due time, or the task's set time). **Hollow tick**: ticked later, filled in on a later day; it still counts, but the chart shows it was back-filled. **Red cross**: missed (due, the day is over, not ticked). **Empty box**: due today, not ticked yet. **Dot**: not scheduled that day. Hover a cell to see when it was ticked and by whom (on shared charts, also who it was done for).
Adherence	A percentage at the end of every row (that item), a number at the foot of every column (that day), and the chart's overall percentage with done/due in its header. Today only counts once ticked, because the day isn't over. **Green** is 90 and above, **amber** 60 to 89, **red** below 60.
Blocks	One block per chart: **Recurring tasks** (your own recurring tasks) first, then every checklist template assigned to you.

A tick is never lost when an item's schedule changes later: a past tick on a day the new schedule skips still shows, and still counts, on that day.

Ticking from the Register: click a cell on your own checklist, for today or any past day the item was due. Un-tick the same way. Future days can never be ticked, on either view (the server refuses it too), and neither can a day the item isn't scheduled.

> ⓘ VIEWING SOMEONE ELSE'S REGISTER
>
> Managers and Reviewers who can view a person's checklist through the person selector see that person's Register too, **read-only**.

Shared charts

A checklist template normally gives each assigned person their own chart. In **Manage**, the template editor has a **Chart** setting: **Each person their own** (the default) or **One shared chart**. A shared chart is one chart for a place or a line (a washroom, say): whoever is assigned ticks it, and the tick records who. Shared charts carry a **Shared chart** tag on My day and in the Register.

On a shared chart an assignee can type a name into **"Ticking for someone? Name them"** before ticking. This is for a supervisor ticking on behalf of floor staff who have no Docket login; the cell then shows "for <name>" on hover. Only the person who ticked it, or the checklist's creator or an admin, can clear a shared tick: a tick is the record. A shared cell someone else ticked shows as read-only for the other assignees. If two people tick the same shared item at the same moment, the first tick stands.

ⓘ THE CHART SETTING LOCKS ONCE USED

A checklist's **Chart** setting (own or shared) can't be switched once anything on it has been ticked.

Assigning a checklist item to someone else

You can create a checklist item for another person, it lands on **their** checklist, not yours, and they tick it off. Use this to hand someone a recurring responsibility (a daily open/close routine, a weekly stock check).

⚠ ONLY THE OWNER TICKS THEIR OWN ITEMS

A manager or reviewer can open a report's checklist through the person picker to **see** how they're doing, but **cannot tick items on their behalf**, the person who owns the item is the only one who marks it done. (Shared charts are the exception: any assignee ticks them.) This keeps a checklist an honest record of what that person actually completed.

Editing & retiring

Click an item's title to open it and change its title or details, or use the pencil in Manage to change the schedule. When a routine is no longer needed, use **Stop** (the circle-slash button) in Manage. It asks for a reason, works like abandoning a task, and the item stops appearing under Today; the history of what was completed is kept.

PART 5

Scratchpad

Your own private notebook with a built-in calculator.

Scratchpad

`/scratchpad` MEMBER REVIEWER ADMIN

The Scratchpad is your own private notebook inside Docket: a place for rough notes, lists and quick sums that belong to nobody but you. It is not a task, not shared, and not tracked, just somewhere to think.

WHAT IT'S FOR	WHO CAN SEE IT	WHO	SAVING
Your private notes and quick maths.	Only you. Always.	MEMBER REVIEWER ADMIN	Automatic, as you type.

Strictly yours

NOBODY ELSE CAN READ YOUR SCRATCHPAD, NOT EVEN AN ADMIN

Scratchpad notes are tied to you and to you alone. There is no admin view, no sharing, no recovery path into them. This is deliberate, so it is a safe place for rough drafts and half-thoughts. The flip side: there is no undo, a deleted note is gone for good.

The layout

On a computer the Scratchpad has up to three columns:

Notes column (left)	All your notes, with a count. The **+** beside the heading creates a new note; click any note to open it. Each note shows its title, or its first line if you haven't titled it. A reminder at the bottom says the notes are private to you.
Editor (middle)	A **Title** box and a large free-text area for the open note. Beside the title are two buttons: a calculator button that shows or hides the calculator, and a bin to delete the note.
Calculator (right)	Shown while a note is open. Hide it with the calculator button if you want the full width for writing; Docket remembers your choice.

On a phone the notes column and the editor take turns. Tap a note to open it, and tap ‹ **Notes** at the top left of the editor to go back to the list.

Writing notes

Type anything in the note area, plain free text. Your changes **save automatically** a moment after you stop typing (and when you switch notes or leave the page), there is no save button. To title a note, fill in the title box at the top; otherwise its first line stands in. To remove a note, use the bin icon next to the title (it asks you to confirm, because there is no undo).

The calculator

Beside an open note sits a real calculator for quick sums while you think, no need to leave Docket or open another app. Type a sum into its display, or tap the on-screen keypad, and the result shows live underneath as you go. It understands the everyday things, plus, minus, times, divide, brackets and percentages:

YOU TYPE	YOU GET
`120 * 4 + 50`	530
`1200 * 18%`	216 (18% of 1200)
`(90 + 60) / 3`	50

A trailing percentage like `18%` is treated as "eighteen hundredths", so `1200 * 18%` gives the tax on 1200. Press `Enter` (or the `=` key) to collapse the sum down to its result, so you can carry on from the answer. `C` clears the display.

✓ KEYBOARD FLOW

While writing a note, press `Tab` to jump straight into the calculator, and `Shift` + `Tab` to jump back to your note. You can do a quick sum and return to typing without touching the mouse.

ⓘ WHAT THE SCRATCHPAD IS NOT

Notes are not tasks. Nothing here shows up on the board, the dashboard or anyone's list, and the calculator works one sum at a time (it doesn't remember running totals between lines). If a note turns into real work, capture it as a task on the Tasks list so it has an owner and a deadline.

PART 6

Dashboard & Reporting

The org-wide review surface, and how to share it.

The Dashboard

`/dashboard` REVIEWER ADMIN

The Dashboard is the bird's-eye view of work across the whole company: how much is overdue, how much is due soon, and how it breaks down by team and by person. It is the screen founders and reviewers open first, and it can be shared with anyone who needs the overview.

WHAT IT'S FOR	READ OR ACT?	WHO	COVERS
The org-wide health of all tasks.	Read-only: a review surface.	REVIEWER ADMIN + anyone it's shared with	All tasks in the General space.

The summary cards

Five summary cards run across the top. Two of them (Overdue and Revised) are clickable shortcuts into the matching task list.

TILE	WHAT IT COUNTS
Overdue (red)	Tasks whose deadline has passed and aren't done. Click to see them.
Due ≤ 7 days	Tasks due within the coming week, your near-term pressure.
Open	Everything still in flight (not done, not abandoned).
Done (30d) (green)	Tasks completed in the last 30 days, recent throughput.
Revised	Tasks whose deadline has been moved at least once. Click to see them.

✓ THE "REVISED" TILE IS A SLIPPAGE GAUGE

Because the original deadline is always locked, the **Deadline revised** count is a direct measure of how often promises are moving. A rising number is an early warning that plans are slipping, well before things actually go overdue.

Status distribution

A single coloured bar shows how all tasks split across the five statuses, Not started, In progress, Done, Blocked, Abandoned, each status taking a share of the bar by its count (hover a segment to see the number), with a legend and the exact counts beneath. It tells you at a glance whether work is moving or piling up.

By team and by person

Two tables break the same work down by who owns it:

- **By team**, one row per department, with Open / Done / Overdue counts. Click a row to jump to that team's tasks.
- **By person**, one row per owner, with the same counts plus a **Last seen** time (when they were last active in Docket) and a small **Load** bar comparing their done and open work. Click a row to see that person's tasks.

An overdue count greater than zero is shown in red, so the teams and people under pressure stand out.

Who can open the Dashboard

Dashboard access is separate from everything else. Three kinds of people can open it:

REVIEWER	Anyone who can see all org tasks gets the Dashboard automatically.
ADMIN	Always.
Granted	Anyone an admin shares it with, even a plain Member, either by turning on “visible to everyone” or by being named individually. See the admin Roles & Permissions chapter.

ⓘ SEEING THE DASHBOARD ISN’T SEEING EVERY TASK

If you've been granted the Dashboard but are otherwise a Member, you see the full org-wide *numbers*, but clicking through to a list still shows only the tasks you're normally allowed to see (your own, your team's, the ones you collaborate on). The overview is shared; the detail stays scoped to you. This is intended.

⚠ IF YOU REACH A “NO ACCESS” MESSAGE

If the Dashboard says you don't have access, it simply hasn't been shared with you. Ask an admin to add you on the Roles & Permissions screen.

PART 7

Administration

Roles, who has which role, dashboard sharing, and the space registry. Admins only.

Roles & Permissions

`/admin/roles` ADMIN

Roles & permissions is where admins decide what kinds of access exist in Docket, and, on the same screen, who can see the Dashboard. It is the control room for access.

WHAT IT'S FOR	READ OR ACT?	WHO	PAIRS WITH
Defining roles + sharing the Dashboard.	Act: create and edit roles.	ADMIN only	The Users screen, which assigns roles.

Finding it

Click **Admin** at the bottom of the icon rail (it opens on this screen), and use the sidebar to move between **Roles & permissions**, **Users** and **Spaces**. Admin does not appear for anyone who is not an admin.

What a role is built from

A Docket role is a name plus up to two switches. That is all there is to it:

SWITCH	WHAT IT GRANTS
See all org tasks + the review dashboard	Org-wide read access and the Dashboard. This is the Reviewer.
Manage roles, assign users & edit/abandon any task	Full management on top. This is the Admin.

A role with **neither** switch on is the baseline Member, a real, useful tier (own + team + collaborator tasks), not a locked-out account.

> ⚠ ADMIN ALWAYS INCLUDES "SEE ALL"
>
> You cannot give someone the management switch without the see-all switch, the screen turns it on for you and won't let you turn it off. It makes no sense to manage tasks you can't see, so Docket guards against it.

Working with roles

1. **Review the role cards.** Each shows its name, what it grants, and whether it is a built-in `system` role.
2. **New Role** creates a custom one: give it a key, a label, an optional description, and flip the switches.
3. **Edit** adjusts a role. For a system role you can change only its label and description, its switches are fixed.
4. **Delete** removes a custom role. You cannot delete a system role, nor one that still has people assigned to it.

> ⓘ THE THREE BUILT-IN ROLES
>
> Docket ships with three system roles: **Admin** (both switches), **Employee** (no switches, the baseline), and **Reviewer** (see-all only). For most companies these are all you need; custom roles are there if you want to name access differently for your own teams.

Dashboard sharing

Like every admin screen, this one is laid out as cards. At the top is a **Dashboard sharing** card, above the **Roles** card. It controls who can open the founder Dashboard, separately from any role, so you can give someone the company overview without giving them access to everything. Two controls:

Visible to everyone	A single toggle. When on, every employee, present and future, can open the Dashboard.
Specific people	Grant the Dashboard to named individuals. Only people with a Docket login can be added. When “visible to everyone” is on, this list is dimmed but kept, so flipping the toggle off restores exactly the grants you had.

> ✓ SHARING THE VIEW, NOT THE TASKS
>
> People you grant the Dashboard to see the org-wide *numbers*, but clicking through still shows only their own tasks. It is a safe way to give leads and stakeholders the high-level picture without exposing every task in the company.

Users

`/admin/users` ADMIN

The Users screen is where an admin gives each person their Docket role. It is a simple list of everyone at LOT with a dropdown next to each name, that is the whole job.

WHAT IT'S FOR	READ OR ACT?	WHO	PAIRS WITH
Assigning a role to each person.	Act: set one role per person.	ADMIN only	Roles & Permissions, which defines the roles.

Finding it

Click **Admin** at the bottom of the icon rail, then **Users** in the sidebar. The page is a single card with a search box in its header.

Reading the list

Each row is one LOT user: their name, email, and current Docket role. Someone with no role shows as **baseline (default)**, which is the full Member tier, not a problem to fix. Search the list by name or email using the box in the header.

Assigning a role

1. **Find the person** by scrolling or searching.
2. **Open the dropdown** in their Assign column.
3. **Choose a role,** or — *none (baseline)* — to return them to the Member default. It saves immediately.

> ⓘ ACCOUNTS COME FROM ELSEWHERE
>
> This screen does not create or remove people, accounts are managed centrally. The Users list shows everyone who can sign in; here you only set their **task-manager access**. If someone is missing from the list, their account hasn't been set up yet.

⚠ MOST PEOPLE NEED NO ROLE

The baseline Member tier already lets people create tasks and see their own and their team's work. Only assign Reviewer or Admin to those who genuinely need to see across the whole company or manage access. When in doubt, leave someone on baseline.

Spaces (Admin)

`/admin/spaces` ADMIN

The admin Spaces screen lists every space in Docket so admins can keep an eye on the registry, and step into an orphaned private space when its owner is gone. It is the one and only sanctioned way an admin can enter a private space.

WHAT IT'S FOR	READ OR ACT?	WHO	SHOWS
Overseeing spaces; rescuing orphaned ones.	Read, plus the audited recover action.	ADMIN only	Space names & counts, never their tasks.

Finding it

Click **Admin** at the bottom of the icon rail, then **Spaces** in the sidebar. The sidebar lists the three admin pages (Roles & permissions, Users, Spaces), and the page is a card containing the table below.

What you can and cannot see

METADATA ONLY, NEVER CONTENTS

This screen shows each space's **name, visibility, owner, member count and creation date**, and nothing more. As an admin you can see that a private space *exists* and who owns it, but you cannot read a single task inside it from here. The wall holds even on the admin screen.

Reading the table

COLUMN	SHOWS
Space	Its name, with a hash icon for General (open) or a padlock for a private space. Archived spaces are dimmed and marked.
Visibility	"Open" (General) or "Private".
Owner	Who owns the private space (General has no owner).
Members	How many people are in it.
Created	When it was made.

Break-glass recovery

If a private space is orphaned, its owner has left and no remaining member can manage it, an admin can recover it. The **Recover** button on a private space makes you its owner and a member, so the space can be managed again.

> ⚠ RECOVERY IS A DELIBERATE, LOGGED ACT
>
> Recovering a space is “breaking glass”: it is meant for genuine emergencies, not casual snooping. The action asks you to confirm, and it is permanently recorded in that space's audit trail. Use it only when there is no owner left to do the right thing, the everyday answer is for an owner to **transfer ownership** before they leave.

> ⓘ AFTER RECOVERY
>
> Once you recover a space you become its owner, so you can then re-assign it: add the right people as members and transfer ownership to whoever should run it. Recovery is a means to hand the space back, not to take it over.
